Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
J	Indicates an Estimated Value for TICs
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.4°C 0.7°C IR-7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Yes, the laboratory case narrative indicated SVOC LCS/LCSD recoveries and LCS/LCSD RPDs were outside evaluation criteria. SVOC surrogate recoveries were outside evaluation criteria in several samples. MS/MSD VOC and PAH recoveries were outside evaluation criteria in sample PD-7-GWP-45-072219. SVOCs and PAHs were detected in the method and equipment blanks. Additionally, the RPDs for PAHs were outside evaluation criteria or the difference in analytical results for PAHs were greater than two times (2X) the reporting level in field duplicate pair PD-17-GWP-50-072219/PD-17-GWP-50-072219-Dup; therefore, results were qualified as estimated (**J**/**J**).These issues are addressed further in the appropriate sections of this data review.

Additionally, the laboratory case narrative indicated three of the 8260 VOCs (2-chloroethyl vinyl ether, acrolein, and acrylonitrile) are acid-reactive compounds; results may be biased low due to the presence of HCl in the preservative.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

Yes

Blank ID	Parameter	Analyte	Concentration/ Amount
PD-17-GWP-50-072219-EB	PAHs	1-Methylnaphthalene	0.079 μg/L

Blank ID	Parameter	Analyte	Concentration/ Amount
PD-17-GWP-50-072219-EB	PAHs	2-Methylnaphthalene	0.11 µg/L
PD-17-GWP-50-072219-EB	SVOCs	di-n-octyl-Phthalate	0.11 µg/L
PD-7-GWP-50-072219-EB	PAHs	1-Methylnaphthalene	0.050 µg/L
PD-7-GWP-50-072219-EB	PAHs	2-Methylnaphthalene	0.074 µg/L
MB 400-449448/1-A	PAHs	1-Methylnaphthalene	0.0335 µg/L
MB 400-449448/1-A	PAHs	2-Methylnaphthalene	0.0549 µg/L

Analytical data that were reported non-detect or at concentrations greater than five times (5X) the associated blank concentration did not require qualification. No qualification of data was needed.

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

No

LCS/LCSD ID	Parameter	Analyte	LCS/ LCSD Recovery	RPD	LCS/LCSD /RPD Criteria
400-449755/1002	VOCs	2-Hexanone	**150**	NA	65-137
400-449755/1002	VOCs	1,1,1,2-Tetrachloroethane	**133**	NA	67-131
400-449448/20-A/21-A	SVOCs	Benzoic acid	30/42	**33**	10-150/30
400-449448/20-A/21-A	SVOCs	2,4-Dinitrotoluene	**56**/67	19	58-140/30
400-449448/20-A/21-A	SVOCs	2,6-Dinitrotoluene	**55**/66	16	57-130/30
400-449448/22-A/23-A	SVOCs	Benzenethiol	**1/3**	**64**	10-120/30

Analytical data that required qualification based on LCS/LCSD data are included in the following table. Analytical data reported as non-detect and associated with LCS recoveries above evaluation criteria, indicating a possible high bias, did not require qualification.

Sample ID	Parameter	Analyte	Qualification
PD-17-GWP-50-072219	SVOCs	Benzenethiol	**UJ**
PD-17-GWP-50-072219	SVOCs	2,4-Dinitrotoluene	**UJ**
PD-17-GWP-50-072219	SVOCs	2,6-Dinitrotoluene	**UJ**
PD-17-GWP-50-072219-DUP	SVOCs	Benzenethiol	**UJ**
PD-17-GWP-50-072219-DUP	SVOCs	2,4-Dinitrotoluene	**UJ**
PD-17-GWP-50-072219-DUP	SVOCs	2,6-Dinitrotoluene	**UJ**
PD-7-GWP-45-072219	SVOCs	Benzenethiol	**UJ**
PD-7-GWP-45-072219	SVOCs	2,4-Dinitrotoluene	**UJ**
PD-7-GWP-45-072219	SVOCs	2,6-Dinitrotoluene	**UJ**

Sample ID	Parameter	Analyte	Qualification
PD-7-GWP-50-072219	SVOCs	Benzenethiol	**UJ**
PD-7-GWP-50-072219	SVOCs	2,4-Dinitrotoluene	**UJ**
PD-7-GWP-50-072219	SVOCs	2,6-Dinitrotoluene	**UJ**
PD-7-GWP-50-072219-DUP	SVOCs	Benzenethiol	**UJ**
PD-7-GWP-50-072219-DUP	SVOCs	2,4-Dinitrotoluene	**UJ**
PD-7-GWP-50-072219-DUP	SVOCs	2,6-Dinitrotoluene	**UJ**

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

No

Sample ID	Parameter	Surrogate	Recovery (%)	Criteria (%)
PD-17-GWP-50-072219-DUP-DL	PAHs	2-Fluorobiphenyl	**127**	15-122
PD-17-GWP-50-072219-DUP-DL	PAHs	Nitrobenzene-d_5	**247**	19-130
PD-17-GWP-50-072219-EB	PAHs	Terphenyl-d_{14}	**200**	33-138
PD-7-GWP-45-072219-MS	SVOCs	Terphenyl-d_{14}	**36**	53-125
PD-7-GWP-45-072219-MSD	SVOCs	Terphenyl-d_{14}	**41**	53-125
PD-7-GWP-50-072219	SVOCs	2-Fluorophenol	**0**	10-120
PD-7-GWP-50-072219	SVOCs	Nitrobenzene-d_5	**0**	27-120
PD-7-GWP-50-072219-Dup	SVOCs	2-Fluorophenol	**0**	10-120
PD-7-GWP-50-072219	SVOCs	Nitrobenzene-d_5	**0**	19-130
PD-7-GWP-50-072219-Dup	SVOCs	Nitrobenzene-d_5	**137**	19-130
PD-7-GWP-50-072219-EB	PAHs	Terphenyl-d_{14}	**142**	33-138

Analytical data that required qualification based on surrogate recovery outside evaluation criteria are included in the table below. Qualifications due to surrogate recoveries were not required if only one of three base/neutral or acid fraction surrogate recoveries were outside evaluation criteria in the associated SVOC samples. Method blanks are quality control samples and do not require qualification.

Sample ID	Parameter	Analyte	Qualification
PD-17-GWP-50-0722919-DUP-DL	PAHs	Acenaphthene	**J**
PD-17-GWP-50-0722919-DUP-DL	PAHs	Fluorene	**J**
PD-17-GWP-50-0722919-DUP-DL	PAHs	1-Methylnaphthalene	**J**
PD-17-GWP-50-0722919-DUP-DL	PAHs	2-Methylnaphthalene	**J**

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

Yes, sample PD-7-GWP-45-072219 was spiked and duplicated for VOCs, SVOCs and PAHs.

Were MS/MSD recoveries within evaluation criteria?

No

MS/MSD ID	Parameter	Analyte	MS/MSD Recovery (%)	RPD	MS/MSD/ RPD Criteria
PD-7-GWP-45-072219	VOCs	Ethyl methacrylate	**134/**129	4	64-130/30
PD-7-GWP-45-072219	PAHs	Benzo[g,h,i]perylene	**41/42**	2	46-133/58

Analytical data that required qualification based on MS/MSD data are included in the table below. Analytical data associated with RPD alone outside evaluation criteria did not require qualification. Analytical data reported as non-detect and associated with MSMSD recoveries above evaluation criteria, indicating a possible high bias, did not require qualification.

Sample ID	Parameter	Analyte	Qualification
PD-7-GWP-45-072219	VOCs	Ethyl methacrylate	**UJ**
PD-7-GWP-45-072219	PAHs	Benzo[g,h,i]perylene	**UJ**

8.0 Internal Standard (IS) Recoveries

Were internal standard area recoveries within evaluation criteria?

Yes

9.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

10.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

Yes

Field ID	Field Duplicate ID
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP
PD-7-GWP-50-072219	PD-7-GWP-50-072219-DUP

Were field duplicate sample RPDs within evaluation criteria?

No

Field ID	Field Duplicate ID	Parameter	Analyte	RPD	Qualification
PD-17-GWP-50-072219-DL	PD-17-GWP-50-072219-DUP-DL	VOCs	Benzene	**32**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP-DL	PAHs	Acenaphthene	**171**	**J/J**

Field ID	Field Duplicate ID	Parameter	Analyte	RPD	Qualification
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Anthracene	**≥2X RL**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Benzo[a]pyrene	**175**	**J/J**
PD-17-GWP-50-072219-DL	PD-17-GWP-50-072219-DUP	PAHs	Benzo[b]fluoran-thene	**≥2X RL**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Chrysene	**176**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Fluoranthene	**≥2X RL**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP-DL	PAHs	Fluorene	**180**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Phenanthrene	**174**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP	PAHs	Pyrene	**175**	**J/J**
PD-17-GWP-50-072219	PD-17-GWP-50-072219-DUP-DL	PAHs	1-Methylnaphthalene	**179**	**J/J**
PD-17-GWP-50-072219-DL	PD-17-GWP-50-072219-DUP-DL	PAHs	2-Methylnaphthalene	**175**	**J/J**

11.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; analytes were detected in samples that were diluted.

12.0 Additional Qualifications

Were additional qualifications applied?

No

eurofins | Environment Testing TestAmerica

No additional comments.

Receipt
The samples were received on 7/23/2019 9:09 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 1.8° C, 2.4° C and 2.7° C.

GC/MS VOA
Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 400-449755 recovered outside control limits for the following analytes: 1,1,1,2-Tetrachloroethane and 2-Hexanone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: The continuing calibration verification (CCV) associated with batch 400-449755 recovered above the upper control limit for 2-Hexanone. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: PD-17-GWP-50-072219 (400-173526-2), PD-17-GWP-50-072219-DUP (400-173526-3), PD-7-GWP-45-072219 (400-173526-5), PD-7-GWP-50-072219 (400-173526-6) and PD-7-GWP-50-072219-DUP (400-173526-7). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The preservative used in the sample containers provided is not compatible with some of the Method 8260 analytes requested. The following samples were received preserved with hydrochloric acid: TB-PW-072219-B (400-173526-1), PD-17-GWP-50-072219 (400-173526-2), PD-17-GWP-50-072219-DUP (400-173526-3), PD-17-GWP-50-072219-EB (400-173526-4), PD-7-GWP-45-072219 (400-173526-5), PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7) and PD-7-GWP-50-072219-EB (400-173526-8). The requested target analyte list includes 2-chloroethyl vinyl ether, Acrolein and Acrylonitrile, which are acid-labile compounds that degrade in an acidic medium.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: PD-7-GWP-45-072219 (400-173526-5[MS]) and PD-7-GWP-45-072219 (400-173526-5[MSD]). These results have been reported and qualified.

Method(s) 8270D: The following analyte(s) recovered outside control limits for the LCS associated with preparation batch 400-449448 and analytical batch 400-450203: 2,4-Dinitrotoluene and 2,6-Dinitrotoluene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method(s) 8270D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch preparation batch 400-449448 and analytical batch 400-450203 recovered outside control limits for the following analytes: Benzoic acid.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450762 recovered above the upper control limit for Dimethyl phthalate, 2-Chloronaphthalene, Diethyl phthalate, 4-Chlorophenyl phenyl ether, 2,4-Dinitrotoluene, Hexachlorocyclopentadiene and Dibenzofuran The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: The following samples were diluted due to the nature of the sample matrix: PD-17-GWP-50-072219-DUP

Job ID: 400-173526-1 (Continued)

Laboratory: Eurofins TestAmerica, Pensacola (Continued)

(400-173526-3) and PD-7-GWP-50-072219 (400-173526-6). Elevated reporting limits (RLs) are provided.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450054 recovered above the upper control limit for Hexachlorobenzene, 4-Bromophenyl phenyl ether, N-Nitrosodimethylamine and 4-Nitrophenol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCVIS 400-450054/2).

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-451086 recovered above the upper control limit for Hexachlorobenzene, 2-Methylphenol, 4,6-Dinitro-2-methylphenol and 4-Bromophenyl phenyl ether. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 400-449448 and analytical batch 400-450054 recovered outside control limits for the following analyte(s): Benzenethiol. Benzenethiol has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method(s) 8270D LL: The method blank for preparation batch 400-449448 and analytical batch 400-450731 contained 1-Methylnaphthalene and 2-Methylnaphthalene above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 8270D LL: The following samples were diluted due to the nature of the sample matrix: PD-17-GWP-50-072219-DUP (400-173526-3). Elevated reporting limits (RLs) are provided.

Method(s) 8270D LL: Surrogate recovery for the following sample was outside control limits: PD-17-GWP-50-072219-DUP (400-173526-3). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8270D LL: The continuing calibration verification (CCV) associated with batch 400-451069 recovered outside acceptance criteria, low biased, for Benzo[b]fluoranthene, Benzo[g,h,i]perylene, Dibenz(a,h)anthracene and Indeno[1,2,3-cd]pyrene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method(s) 8270D LL: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-449448 and analytical batch 400-451069 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 8270D LL: Three surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: PD-17-GWP-50-072219-EB (400-173526-4), PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7), PD-7-GWP-50-072219-EB (400-173526-8). These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits
B	Compound was found in the blank and sample.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Indicates an Estimated Value for TICs
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)

Creator: Hinrichsen, Megan E

List Source: Eurofins TestAmerica, Pensacola

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.8°C, 2.7°C, 2.4°C IR-8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Accreditation/Certification Summary

Comments
Revised Report
Report revised to correct TIC reporting for both the VOC and SVOC analysis due to evaluation error.
Supersedes report dated 8-12-19.

Receipt
The samples were received on 7/23/2019 9:09 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 1.8º C, 2.4º C and 2.7º C.

GC/MS VOA
Method(s) 8260B: The laboratory control sample (LCS) for analytical batch 400-449755 recovered outside control limits for the following analytes: 1,1,1,2-Tetrachloroethane and 2-Hexanone. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: The continuing calibration verification (CCV) associated with batch 400-449755 recovered above the upper control limit for 2-Hexanone. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been reported.

Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: PD-17-GWP-50-072219 (400-173526-2), PD-17-GWP-50-072219-DUP (400-173526-3), PD-7-GWP-45-072219 (400-173526-5), PD-7-GWP-50-072219 (400-173526-6) and PD-7-GWP-50-072219-DUP (400-173526-7). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The preservative used in the sample containers provided is not compatible with some of the Method 8260 analytes requested. The following samples were received preserved with hydrochloric acid: TB-PW-072219-B (400-173526-1), PD-17-GWP-50-072219 (400-173526-2), PD-17-GWP-50-072219-DUP (400-173526-3), PD-17-GWP-50-072219-EB (400-173526-4), PD-7-GWP-45-072219 (400-173526-5), PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7) and PD-7-GWP-50-072219-EB (400-173526-8). The requested target analyte list includes 2-chloroethyl vinyl ether, Acrolein and Acrylonitrile, which are acid-labile compounds that degrade in an acidic medium.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: PD-7-GWP-45-072219 (400-173526-5[MS]) and PD-7-GWP-45-072219 (400-173526-5[MSD]). These results have been reported and qualified.

Method(s) 8270D: The following analyte(s) recovered outside control limits for the LCS associated with preparation batch 400-449448 and analytical batch 400-450203: 2,4-Dinitrotoluene and 2,6-Dinitrotoluene. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

Method(s) 8270D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch preparation batch 400-449448 and analytical batch 400-450203 recovered outside control limits for the following analytes: Benzoic acid.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450762 recovered above the upper control limit for Dimethyl phthalate, 2-Chloronaphthalene, Diethyl phthalate, 4-Chlorophenyl phenyl ether, 2,4-Dinitrotoluene, Hexachlorocyclopentadiene and Dibenzofuran The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Job ID: 400-173526-1 (Continued)

Laboratory: Eurofins TestAmerica, Pensacola (Continued)

Method(s) 8270D: The following samples were diluted due to the nature of the sample matrix: PD-17-GWP-50-072219-DUP (400-173526-3) and PD-7-GWP-50-072219 (400-173526-6). Elevated reporting limits (RLs) are provided.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450054 recovered above the upper control limit for Hexachlorobenzene, 4-Bromophenyl phenyl ether, N-Nitrosodimethylamine and 4-Nitrophenol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCVIS 400-450054/2).

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-451086 recovered above the upper control limit for Hexachlorobenzene, 2-Methylphenol, 4,6-Dinitro-2-methylphenol and 4-Bromophenyl phenyl ether. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 400-449448 and analytical batch 400-450054 recovered outside control limits for the following analyte(s): Benzenethiol. Benzenethiol has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method(s) 8270D LL: The method blank for preparation batch 400-449448 and analytical batch 400-450731 contained 1-Methylnaphthalene and 2-Methylnaphthalene above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 8270D LL: The following samples were diluted due to the nature of the sample matrix: PD-17-GWP-50-072219-DUP (400-173526-3). Elevated reporting limits (RLs) are provided.

Method(s) 8270D LL: Surrogate recovery for the following sample was outside control limits: PD-17-GWP-50-072219-DUP (400-173526-3). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method(s) 8270D LL: The continuing calibration verification (CCV) associated with batch 400-451069 recovered outside acceptance criteria, low biased, for Benzo[b]fluoranthene, Benzo[g,h,i]perylene, Dibenz(a,h)anthracene and Indeno[1,2,3-cd]pyrene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method(s) 8270D LL: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-449448 and analytical batch 400-451069 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 8270D LL: Three surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: PD-17-GWP-50-072219-EB (400-173526-4), PD-7-GWP-50-072219 (400-173526-6), PD-7-GWP-50-072219-DUP (400-173526-7), PD-7-GWP-50-072219-EB (400-173526-8). These results have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
*	ISTD response or retention time outside acceptable limits
*	RPD of the LCS and LCSD exceeds the control limits
B	Compound was found in the blank and sample.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
J	Indicates an Estimated Value for TICs
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.8°C, 2.7°C, 2.4°C IR-8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Yes, the laboratory case narrative indicated the SVOC compound di-n-octyl phthalate was detected in the method blank. VOCs and SVOCs were detected in equipment blanks. SVOC LCS/LCSD recoveries and LCS/LCSD RPDs were outside evaluation criteria. Recoveries of the SVOC surrogate 2-fluorophenol were outside evaluation criteria in samples PD-3-GWP-50-072319 and the method blank. These issues are addressed further in the appropriate sections of this data review.

Additionally, the laboratory case narrative indicated three of the 8260 VOCs (2-chloroethyl vinyl ether, acrolein, and acrylonitrile) are acid-reactive compounds; results may be biased low due to the presence of HCl in the preservative.

The cooler receipt form indicated equipment blank PD-3-GWP-50-072319-EB was included in the cooler, however not on the COC; the equipment blank was analyzed and reported correctly; no qualification of data was required.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

Yes

Blank ID	Parameter	Analyte	Concentration/ Amount
MB 400-449716/1-A	SVOCs	di-n-octyl-Phthalate	2.53 µg/L
PD-7-GWP-55-072319-EB	VOCs	Benzene	7.0 µg/L
PD-7-GWP-55-072319-EB	VOCs	2-Butanone	2.6 µg/L
PD-7-GWP-55-072319-EB	SVOCs	di-n-octyl-Phthalate	2.0 µg/L
PD-3-GWP-50-072319-EB	PAHs	di-n-octyl-Phthalate	1.2 µg/L

Qualifications due to blank contamination are included in the table below. Analytical data that were reported non-detect or at concentrations greater than five times (5X) the associated blank concentration, ten times (10X) for common laboratory contaminants, did not require qualification.

Sample ID	Parameter	Analyte	New Reporting Limit (RL)	Qualification
PD-7-GWP-55-072319	SVOCs	di-n-octyl-Phthalate	-	**U**
PD-3-GWP-45-072319	SVOCs	di-n-octyl-Phthalate	-	**U**
PD-3-GWP-60-072319	SVOCs	di-n-octyl-Phthalate	-	**U**
PD-3-GWP-65-072319	SVOCs	di-n-octyl-Phthalate	-	**U**
PD-3-GWP-71-072319	SVOCs	di-n-octyl-Phthalate	-	**U**

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

No

LCS/LCSD ID	Parameter	Analyte	LCS/ LCSD Recovery	RPD	LCS/LCSD /RPD Criteria
400-449716/14-A	SVOCs	Benzenethiol	**3/3**	3	10-120/30
400-449716/2-A/3-A	SVOCs	Aniline	48/68	**35**	29-120/
400-449716/2-A/3-A	SVOCs	Hexachlorocyclopentadiene	28/45	**46**	10-129/30

Analytical data that required qualification based on LCS/LCSD data are included in the following table. Analytical data reported as non-detect and associated with LCS recoveries above evaluation criteria, indicating a possible high bias, did not require qualification.

Sample ID	Parameter	Analyte	Qualification
PD-7-GWP-55-072319	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-45-072319	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-50-072319	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-50-072319-DUP	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-55-072319	SVOCs	Benzenethiol	**UJ**

Sample ID	Parameter	Analyte	Qualification
PD-3-GWP-60-072319	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-65-072319	SVOCs	Benzenethiol	**UJ**
PD-3-GWP-71-072319	SVOCs	Benzenethiol	**UJ**

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

No

Sample ID	Parameter	Surrogate	Recovery (%)	Criteria (%)
PD-3-GWP-50-072319	SVOCs	2-Fluorophenol	**0**	10-120
MB 400-449716/1-A	SVOCs	2-Fluorophenol	**9**	10-120

Qualifications due to surrogate recoveries were not required if only one of three base/neutral fraction surrogate recoveries were outside evaluation criteria in the associated SVOC samples. No qualification of data was required.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Internal Standard (IS) Recoveries

Were internal standard area recoveries within evaluation criteria?

Yes

9.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

10.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

11.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; analytes were detected in samples that were diluted.

12.0 Additional Qualifications

Were additional qualifications applied?

No

No additional comments.

Receipt
The samples were received on 7/24/2019 8:59 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 0.2° C, 2.3° C and 2.4° C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): PD-3-GWP-50-072319-EB (400-173575-11)

GC/MS VOA
Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: PD-7-GWP-55-072319 (400-173575-2), PD-3-GWP-45-072319 (400-173575-4), PD-3-GWP-50-072319 (400-173575-5), PD-3-GWP-50-072319-DUP (400-173575-6), PD-3-GWP-55-072319 (400-173575-7), PD-3-GWP-60-072319 (400-173575-8), PD-3-GWP-65-072319 (400-173575-9), PD-3-GWP-71-072319 (400-173575-10). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The preservative used in the sample containers provided is not compatible with some of the Method 8260 analytes requested. The following samples were received preserved with hydrochloric acid: TB-PW-072319-B (400-173575-1), PD-7-GWP-55-072319 (400-173575-2), PD-7-GWP-55-072319-EB (400-173575-3), PD-3-GWP-45-072319 (400-173575-4), PD-3-GWP-50-072319 (400-173575-5), PD-3-GWP-50-072319-DUP (400-173575-6), PD-3-GWP-55-072319 (400-173575-7), PD-3-GWP-60-072319 (400-173575-8), PD-3-GWP-65-072319 (400-173575-9), PD-3-GWP-71-072319 (400-173575-10) and PD-3-GWP-50-072319-EB (400-173575-11). The requested target analyte list include 2-chloroethyl vinyl ether, Acrolein and Acrylonitrile, which are acid-labile compounds that degrade in an acidic medium.

Method(s) 8260B: Sample PD-7-GWP-55-072319-EB (400-173575-3) contained Benzene above the reporting limit and 2-Butanone (MEK) above the MDL limit. Reanalysis was performed with concurring results.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450762 recovered above the upper control limit for Dimethyl phthalate, 2-Chloronaphthalene, Diethyl phthalate, 4-Chlorophenyl phenyl ether, 2,4-Dinitrotoluene, Hexachlorocyclopentadiene and Dibenzofuran The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: PD-3-GWP-50-072319 (400-173575-5). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450993 recovered above the upper control limit for 2,4-Dinitrotoluene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450993 recovered outside acceptance criteria, low biased, for Aniline, 4,6-Dinitro-2-methylphenol and Hexachlorocyclopentadiene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method(s) 8270D: The method blank for preparation batch 400-449716 and analytical batch 400-450897 contained Di-n-octyl phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Job ID: 400-173575-1 (Continued)

Laboratory: Eurofins TestAmerica, Pensacola (Continued)

Method(s) 8270D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch preparation batch 400-449716 and analytical batch 400-450897 recovered outside control limits for the following analytes: Aniline and Hexachlorocyclopentadiene.

Method(s) 8270D: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 400-449716 and analytical batch 400-450897 recovered outside control limits for the following analyte(s): Benzenethiol. Benzenethiol has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 400-449716/1-A). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450897 recovered above the upper control limit for 4,6-Dinitro-ortho-cresol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D LL: The continuing calibration verification (CCV) associated with batch 400-451066 recovered outside acceptance criteria, low biased, for Benzo[g,h,i]perylene and Indeno[1,2,3-cd]pyrene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Definitions/Glossary

Client: AECOM Technical Services Inc. Job ID: 400-173575-1
Project/Site: PreDesign Invest PW

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	RPD of the LCS and LCSD exceeds the control limits
*	LCS or LCSD is outside acceptance limits.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	1011637,1011636, 1011638,1011639, 622045, 622044
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	0.2°C, 2.4°C, 2.3°C IR-8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
Revised Report
Report revised to correct TIC reporting for the SVOC analysis due to evaluation error.
Supersedes report dated 8-13-19.

Receipt
The samples were received on 7/24/2019 8:59 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 3 coolers at receipt time were 0.2º C, 2.3º C and 2.4º C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): PD-3-GWP-50-072319-EB (400-173575-11)

GC/MS VOA
Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: PD-7-GWP-55-072319 (400-173575-2), PD-3-GWP-45-072319 (400-173575-4), PD-3-GWP-50-072319 (400-173575-5), PD-3-GWP-50-072319-DUP (400-173575-6), PD-3-GWP-55-072319 (400-173575-7), PD-3-GWP-60-072319 (400-173575-8), PD-3-GWP-65-072319 (400-173575-9), PD-3-GWP-71-072319 (400-173575-10). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The preservative used in the sample containers provided is not compatible with some of the Method 8260 analytes requested. The following samples were received preserved with hydrochloric acid: TB-PW-072319-B (400-173575-1), PD-7-GWP-55-072319 (400-173575-2), PD-7-GWP-55-072319-EB (400-173575-3), PD-3-GWP-45-072319 (400-173575-4), PD-3-GWP-50-072319 (400-173575-5), PD-3-GWP-50-072319-DUP (400-173575-6), PD-3-GWP-55-072319 (400-173575-7), PD-3-GWP-60-072319 (400-173575-8), PD-3-GWP-65-072319 (400-173575-9), PD-3-GWP-71-072319 (400-173575-10) and PD-3-GWP-50-072319-EB (400-173575-11). The requested target analyte list include 2-chloroethyl vinyl ether, Acrolein and Acrylonitrile, which are acid-labile compounds that degrade in an acidic medium.

Method(s) 8260B: Sample PD-7-GWP-55-072319-EB (400-173575-3) contained Benzene above the reporting limit and 2-Butanone (MEK) above the MDL limit. Reanalysis was performed with concurring results.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450762 recovered above the upper control limit for Dimethyl phthalate, 2-Chloronaphthalene, Diethyl phthalate, 4-Chlorophenyl phenyl ether, 2,4-Dinitrotoluene, Hexachlorocyclopentadiene and Dibenzofuran The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: PD-3-GWP-50-072319 (400-173575-5). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450993 recovered above the upper control limit for 2,4-Dinitrotoluene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450993 recovered outside acceptance criteria, low biased, for Aniline, 4,6-Dinitro-2-methylphenol and Hexachlorocyclopentadiene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method(s) 8270D: The method blank for preparation batch 400-449716 and analytical batch 400-450897 contained Di-n-octyl phthalate

Job ID: 400-173575-1 (Continued)

Laboratory: Eurofins TestAmerica, Pensacola (Continued)

above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 8270D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for batch preparation batch 400-449716 and analytical batch 400-450897 recovered outside control limits for the following analytes: Aniline and Hexachlorocyclopentadiene.

Method(s) 8270D: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for preparation batch 400-449716 and analytical batch 400-450897 recovered outside control limits for the following analyte(s): Benzenethiol. Benzenethiol has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. Batch precision also exceeded control limits for these analyte(s). These results have been reported and qualified.

Method(s) 8270D: Six surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 400-449716/1-A). These results have been reported and qualified.

Method(s) 8270D: The continuing calibration verification (CCV) associated with batch 400-450897 recovered above the upper control limit for 4,6-Dinitro-ortho-cresol. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method(s) 8270D LL: The continuing calibration verification (CCV) associated with batch 400-451066 recovered outside acceptance criteria, low biased, for Benzo[g,h,i]perylene and Indeno[1,2,3-cd]pyrene. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
*	RPD of the LCS and LCSD exceeds the control limits
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	Presumptive evidence of material.
T	Result is a tentatively identified compound (TIC) and an estimated value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

CONFIDENTIAL SETTLEMENT COMMUNICATION

Login Sample Receipt Checklist

Client: AECOM Technical Services Inc.

Job Number: 400-173575-1

Login Number: 173575
List Number: 1
Creator: Perez, Trina M

List Source: Eurofins TestAmerica, Pensacola

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	1011637,1011636, 1011638,1011639, 622045, 622044
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	0.2°C, 2.4°C, 2.3°C IR-8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Accreditation/Certification Summary

Client: AECOM Technical Services Inc. Job ID: 400-173575-1
Project/Site: PreDesign Invest PW

Laboratory: Eurofins TestAmerica, Pensacola

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-165969

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 7/29/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-8-GWP-35-062819

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Comments
No additional comments.

Receipt
The sample was received on 6/29/2019 9:40 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.1° C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Job ID: 500-165969-1

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.1
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-166405

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 8/9/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-13-GWP-46-070819

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate. Initial volumes used for sample PD-13-GWP-46-070819 were outside those used by standard procedure due to matrix interference; reporting limits were adjusted accordingly and no qualification of data was required.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Comments
No additional comments.

Receipt
The sample was received on 7/10/2019 9:10 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.7° C.

Metals
Method(s) 3005A: Due to the matrix, the initial volume(s) used for the following sample deviated from the standard procedure: PD-13-GWP-46-070819 (500-166405-1). The reporting limits (RLs) have been adjusted proportionately.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
Method(s) SM 4500 NO2 B: The continuing calibration verification (CCV) associated with batch 500-494220 recovered above the upper control limit for Nitrogen, Nitrite at 112%. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: PD-13-GWP-46-070819 (500-166405-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Client: AECOM Technical Services Inc.

Job Number: 500-166405-1

Login Number: 166405
List Number: 1
Creator: Buckley, Paula M

List Source: Eurofins TestAmerica, Chicago

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The accreditations/certifications listed below are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Illinois	NELAP	5	200041	10-09-19

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-166811

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 8/9/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-4-GWP-60-071619

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Comments
No additional comments.

Receipt
The sample was received on 7/17/2019 11:12 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.6° C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

After printing this label:
CONSIGNEE COPY - PLEASE PLACE IN FRONT OF POUCH
1. Fold the printed page along the horizontal line
2. Place label in shipping pouch and affix it to your shipment.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of $100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of $100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is $1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.6
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-166907

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 8/9/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-14-GWP-70-071719

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Definitions/Glossary

Client: AECOM Technical Services Inc.
Project/Site: PreDesign Invest PW

Job ID: 500-166907-1

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job Number: 500-166907-1

Login Number: 166907
List Number: 1
Creator: James, Jeff A

List Source: Eurofins TestAmerica, Chicago

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.1
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-166958

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 8/9/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-2-GWP-50-071719

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Job ID: 500-166958-1

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.9
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Roxana Predesign Water Quality Data Review

Laboratory SDG: 500-167098

Data Reviewer: Elizabeth Kunkel

Peer Reviewer: Jeff Aust

Date Reviewed: 8/9/2019

Guidance: USEPA National Functional Guidelines for Superfund Inorganic Methods Data Review 2017

Sample Identification
PD-7-GWP-45-072219

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Although not indicated in the laboratory case narrative, ferrous iron, total residual chlorine and pH were analyzed outside the EPA recommended analysis holding time of 15 minutes and results should be considered approximate.

The cooler receipt form did not indicate any problems.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes, with the exceptions of ferrous iron, total residual chlorine and pH discussed in section 2.0 of this data review.

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

Yes

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Samples were analyzed for total and dissolved ICP metals, hardness as calcium carbonate, sulfate, nitrate, alkalinity, total dissolved solids, ferrous iron, chloride, chlorine, nitrite, phosphate and pH. Surrogates are not required for these analyses.

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Laboratory Duplicate Results

Were laboratory duplicate samples analyzed as part of this SDG?

No

9.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

10.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

11.0 Additional Qualifications

Were additional qualifications applied?

No

Comments
No additional comments.

Receipt
The sample was received on 7/23/2019 10:00 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.1° C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Login Sample Receipt Checklist

Client: AECOM Technical Services Inc.

Job Number: 500-167098-1

Login Number: 167098
List Number: 1
Creator: James, Jeff A

List Source: Eurofins TestAmerica, Chicago

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.1
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Accreditation/Certification Summary

Client: AECOM Technical Services Inc.

Notes:

1. Values are only reported if a TIC is identified
2. The number of significant figures is laboratory-specific.

Compound was not detected, tentatively identified compound (TIC) search was performed.

LABORATORY QUALIFIERS

J = The analyte was detected below the reporting limit. Result is estimated.

T = Result is a tentatively identified compound (TIC) and an estimated value.

N - Presumptive evidence of material.

<#.## Indicates the analyte was not detected above the given reporting limit.

AECOM QUALIFIERS

J = The result is estimated.

UJ = Estimated non-detect.

U = Result is non-detect.

Notes:

1. Values are only reported if a TIC is identified
2. The number of significant figures is laboratory-specific.

Compound was not detected, tentatively identified compound (TIC) search was performed.

LABORATORY QUALIFIERS

J = The analyte was detected below the reporting limit. Result is estimated.

T = Result is a tentatively identified compound (TIC) and an estimated value.

N - Presumptive evidence of material.

<#.## Indicates the analyte was not detected above the given reporting limit.

AECOM QUALIFIERS

J = The result is estimated.

UJ = Estimated non-detect.

U = Result is non-detect.

Appendix H – Summary of Groundwater VOC and SVOC TIC Analytical Detections

Notes:

1. Values are only reported if a TIC is identified
2. The number of significant figures is laboratory-specific.

Compound was not detected, tentatively identified compound (TIC) search was performed.

LABORATORY QUALIFIERS

J = The analyte was detected below the reporting limit. Result is estimated.

T = Result is a tentatively identified compound (TIC) and an estimated value.

N - Presumptive evidence of material.

H = Sample was prepared or analyzed beyond the specified holding time

AECOM QUALIFIERS

J = The result is estimated.

UJ = Estimated non-detect.

U = Result is non-detect.

Notes:

1. Values are only reported if a TIC is identified
2. The number of significant figures is laboratory-specific.

Compound was not detected, tentatively identified compound (TIC) search was performed.

LABORATORY QUALIFIERS

J = The analyte was detected below the reporting limit. Result is estimated.

T = Result is a tentatively identified compound (TIC) and an estimated value.

N - Presumptive evidence of material.

H = Sample was prepared or analyzed beyond the specified holding time

AECOM QUALIFIERS

J = The result is estimated.

UJ = Estimated non-detect.

U = Result is non-detect.

Appendix I – Summary of Westhollow Results

PWY Soil and Water Samples

OBSERVATIONS

- separate phase(NAPL) not observed in liquid samples
- all samples extracted with methylene chloride upon arrival to the lab (entire sample extracted)

RESULTS

- 15 of 19 liquid samples contain benzene
- none of the 11 soil samples contained benzene above the reporting limit
- 4 liquid and 2 soil samples contain gasoline range and kerosene range material at low levels

CONTENTS

Page 2: Mapped benzene data
Page 3: Mapped chromatography
Page 4: Stacked chromatograms for samples (4 liquid, 2 soil) containing gasoline range material and kerosene range material
Pages 5-10: Individual chromatograms of samples containing gasoline range material and kerosene range material [PD 11-39 and PD 11-40 may also contain material heavier than kerosene]
Pages 11-13: Soil sample chromatographs
Pages 14-17: Liquid sample chromatographs.'
Pages 18-21: COCs

This document, *100% Remedial Design Report for the Roxana Public Works Site* in *Roxana, Illinois* is being issued as a final design report and is intended for construction. The work and professional opinions rendered in this report were conducted or developed in accordance with commonly accepted protocols and procedures. This design takes into consideration information received up to December 27, 2021. If conditions are discovered that differ from those described, the undersigned engineer should be notified to evaluate the effects of any additional information on the assessment and recommendations in this document. This document was prepared to provide information for the Roxana Public Works site, located in Roxana, Illinois, and should not be construed to apply to any other site.

Note that Alberta engineering regulations require the final document to be sealed by an Alberta-registered professional engineer, since the design was performed in Alberta, even though the project site is in the United Stated. This in no way is intended to infringe upon American engineering laws and regulations, or those of any other jurisdiction. Please be aware that this document requires further engineering review and certification in accordance with local State and Provincial laws and regulations.

Executive Summary

McMillan-McGee (Mc^2) has prepared this report to describe the details of the in-situ thermal remediation process that will be implemented at the Roxana Public Works site, located in Roxana, Illinois (Site). The remedial goals for the Site will be achieved using steam injection with a Site-specific multi-phase extraction and treatment system.

The Site is divided into two adjacent thermal treatment zones (TTZ): Areas A and B. The Area A heated area is approximately 28,000 square feet (ft^2) with a treatment interval between 397 and 378 feet above mean seal level (ft amsl); Area B is approximately 20,150 ft^2 with a treatment interval between 395 and 389 ft amsl. The heated area is defined as the area that extends 3 feet (ft) beyond the perimeter steam injection well locations. The treatment area is defined as any zone within the perimeter steam injection wells that is within the defined treatment interval for TTZ Area A and B. These areas and intervals correspond to a heated volume of approximately 18,700 cubic yards (yd^3) for Area A and 4,475 yd^3 for Area B.

During remedial activities, 81 single-screen steam injection wells will heat the treatment volume, to a minimum target temperature of 176.3 degrees Fahrenheit (°F) [80.2 degrees Celsius (°C)] or greater, corresponding to the minimum depth-dependent co-boiling temperature of benzene and water. The cumulative energy input to the steam injection wells has been conservatively estimated to be 9,087 megawatt-hours (MWh). Injection to individual steam injection wells will be approximately 61 to 125 pounds per hour (lbs/hr) for a total injection of approximately 5,000 to 10,000 lbs/hr. Operations will run for approximately 180 days.

There will be 36 multiphase extraction (MPE) wells completed with downhole pneumatic pumps. The treatment system is designed for a maximum total field vapor flow of 1,799 standard cubic feet per minute (SCFM) at a maximum vacuum of 12 inches of mercury (inHg), and an estimated total liquid extraction rate from all the wells between 20.0 and 40.2 gallons per minute (GPM).

Performance monitoring of the steam enhanced extraction (SEE) system will include the deployment of 120 digital temperature acquisition module (digiTAM™) sensors in 16 locations, measurements of fluid flow and input energy, and continuous monitoring of volatile organic compounds in the vapor stream. All data will be available on a secure webpage for remote monitoring.

1. Introduction

The following Remedial Design Report, prepared by Mc^2, describes the in-situ thermal treatment (ISTT) process to be deployed at the Roxana Public Works Yard (PWY).

1.1. Treatment Site Description and Location

The PWY is located in a mixed use area surrounded by industrial users, primarily petroleum refining and storage facilities. The Site is bounded by Old Edwardsville Road to the west, East Eighth Street to the north, a rail corridor to the south, the Phillips 66 Wood River Refinery (WRR) directly to the east (See Figure 1). The nearest residential properties are located on the north side of East Eighth Street approximately 80 feet from TTZ Area A.

The property has an areal extent of approximately 2.4 acres, approximately 0.4 acres of which is covered or obstructed buildings or structures (AECOM, 2019). The TTZ is approximately 48,000 ft^2.

Figure 1: Aerial photograph of site

1.2. Site Geology and Hydrology

The geology of the Site, within the TTZ, generally consists of medium to course grained sand with interbedded silty zones that are relatively thin and discontinuous (AECOM, 2020). A full description of the subsurface is described in

Table 1 below:

Table 1: Geology (AECOM, 2020)

Thickness (ft)	Material	Description
0 to 5	Fill	Clay, gravel, cinders. Discontinuous across the site.
3 to 15	Silty Clay	Silty clay. Area B is generally thinner (~5 ft); Area A is generally thicker (up to 15 ft).
~45	Medium Sand	Primarily medium grained sand down to approximately 60 ft below ground surface (ft BGS).
>30	Medium/Course Sand	Transition to medium/course grained sand to depths of 93 ft BGS.

Groundwater within the TTZ ranges between 28 and 37 ft BGS, depending on where it is measured on site and of course precipitation and flow conditions in the Mississippi River. Groundwater flow direction, which was once toward the Mississippi (toward the west), is now toward the industrial pumping wells operated by WRR east of the Site.

With regards to thermal treatment, the geology (and hydrogeology) is excellent for steam injection. The Environmental Protection Agency (EPA) recommends hydraulic conductivities greater than 10^{-4} centimeters per second (cm/s) for steam injection (EPA, 2015). The average horizontal hydraulic conductivity of the formation within the TTZ is 1.24 x 10^{-2} cm/s. Even with the high permeability and relatively high pumping rate from the WRR (minimum 3000 gallons per minute (GPM) (AECOM, 2019)), the groundwater velocities reported in the RFP are relatively low at 0.1 to 0.3 feet per day (ft/day). This means that the energy losses associated with groundwater influx are anticipated to be relatively low.

1.3. Contaminant Distribution and Remedial Goals

The primary contaminant of concern (COC) at the site is benzene. However, a total of 142 volatile and semi volatile organic compounds (VOC and SVOC) were analyzed for in both the soil and groundwater at the Site and a number of other VOCs and SVOCs were identified to be present. Benzene was the mostly commonly encountered contaminant while 1-methylnapthalene was the second most commonly encountered contaminant in both soil and groundwater (AECOM, 2019). Kerosene is present in a localized area.

The primary remedial objective for the thermal treatment is to reduce the mass of COCs within the treatment area. In achievement of the primary remedial objective, the secondary remedial objectives are as follows:

1. Achievement of the average temperatures within the heated volume of at least 176.3 degrees Fahrenheit (°F) [80.2°C]. Targeting this temperature at the actual temperature sensors, which are primarily located at the centroids of triangles formed by three steam injection wells, will result in higher temperatures than measured by these sensors in the majority of the SEE zone. It should be noted that

each temperature sensor is located greater than or equal to 8 ft away from the nearest steam injection location. Most regions of the heated volume are expected to have higher temperatures than those measured at the sensor locations. This means that achievement of target temperatures at the sensors indicates that temperatures in most other areas of the treatment zone will be at or above the design temperature;

   a. Note that the thermal system will approach average temperatures within the heated volume of approximately 212°C [100°C].

2. Achievement of asymptotic conditions. Typically, the cumulative contaminant mass recovery curve at an in-situ thermal remediation site follows a sigmoid shape, with maximum recovery rates (indicated by the steepest slope) towards the middle part of the project. Logistic functions are often used to model phenomena that exhibit a sigmoid curve. Because the slope of the sigmoid shape, Gaussian functions can be used to approximate mass recovery rates (or concentrations, assuming vapor flow rates are constant).

   An asymptotic trend in the cumulative mass removal curve often indicates when continued thermal operations may be providing diminishing returns in mass removal, and can be used to help schedule confirmation soil and/or groundwater sampling activities. This trend in cumulative mass recovery typically refers to the time period when contaminant mass recovery rates have diminished to the point that further mass recovery increases very slowly in comparison to the midpoint of the remediation. The precise value at which this occurs must be defined; typically 10% of the peak performance when evaluating concentration data.

   Once the temperature performance goals have been achieved and the cumulative mass curve appears to reach asymptotic conditions, the following steps will be used to determine if the total COC mass recovery rates (i.e., pounds per day (lbs/day)) are at asymptotic levels:

   a. Verify that temperature performance goals have been achieved;

   b. Verify that the system volumetric flow rate is not less than 70 percent of the average. If volumetric flow rate is unusually low, troubleshoot field operations. Correct any operational issues; and,

   c. Determine the mass recovery rate for at least four consecutive sampling events over a period of 14 days. Treatment goals have been achieved when mass recovery rates remain below 10% of the peak recovery rate (i.e., from 1,000 lbs/day [peak] to 100 lbs/day [asymptotic]), or statistical trend analysis (Mann-Kendall test) of the data show a linear mass recovery curve (linear mass recovery

indicates steady mass flux from the outside of the treatment volume; exponentially decaying mass recovery indicates continued volatilization of mass from inside of the treatment volume).

3. Pneumatic and hydraulic control of the treatment area shall be maintained during the length of remedial activities; and,
4. All recovered groundwater and soil vapor shall be treated to meet applicable discharge permit stipulations.

1.4. Project Team

The project team, shown in Table 2 is primarily comprised of personnel from AECOM and Mc^2.

1.5. Project Schedule

Please refer to Table 3 for approximate durations of different phases of the project, and to Appendix E for a responsibility matrix outlining the responsibilities of the various organizations in the Project Team.

Table 3: Roxana Project Phases and Approximate Duration

Item	Duration	Notes
Equipment Procurement	12-16 weeks	
Installation	12-14 weeks	Drilling, civil work, surface connections
Acceptance Testing	1-2 weeks	
Operations & Maintenance	~6 months	Initial estimate based on supplied information. Final determination after the numerical simulation.
Demobilization	3-4 weeks	Subsurface wells to be abandoned in place and all other recoverable equipment is removed.
Operational Data Delivery	4-6 weeks	AECOM responsible for the final report, but Mc^2 would provide all relevant SEE operations data.

1.6. Schedule Constraints

The regenerative thermal oxidizer (RTO) media will be changed out in spring 2020, prior to start-up.

2. Treatment Technology

The remediation will incorporate the use of steam enhanced extraction. Efficient recovery of VOCs in the vapor phase is applicable to compounds with a vapor pressure and a Henry's law constant greater than 0.02 inHg and 0.01, respectively. VOC vapors produced in the subsurface will be captured with MPE wells and processed in an aboveground treatment system before discharge. Steam will be injected into the formation in dedicated wells where power energy input is controlled on an individual well basis so that uniform heating and treatment can be achieved.

2.1. SEE Mass Removal Mechanisms

At elevated temperatures, vaporization, volatilization, dissolution and desorption are enhanced, such that conditions are more favorable for the removal of VOCs from the subsurface (e.g., United States Army Corp of Engineers (USACE), 2009; Triplett Kingston et al., 2014). These mechanisms are described by the temperature dependence of the vapor pressures, Henry's law constants, solubilities and soil-water partition coefficients for the fluids in question, respectively (e.g., Figure 2; Table 4). In addition, liquid viscosities, non-aqueous phase liquid (NAPL)-water interfacial tensions and densities decrease at elevated temperatures, which can enhance NAPLs mobility.

Vaporization (i.e., boiling of immiscible VOCs and groundwater) and volatilization (i.e., partitioning of VOCs from the dissolved phase to the gas phase) are the most dominant mass removal mechanisms during SEE. For example, the vapor pressures and Henry's law constants of Benzene, tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dicloroethene (cis-1,2-DCE), and vinyl chloride (VC) increase approximately 10- to 30-fold from ambient to near-boiling temperatures. As such, extraction wells must be designed to effectively capture the produced gas, with appropriate locations, screened intervals and applied vacuums, for performance to be successful. The accurate development of a detailed geological and hydrogeological site conceptual model informs this design.

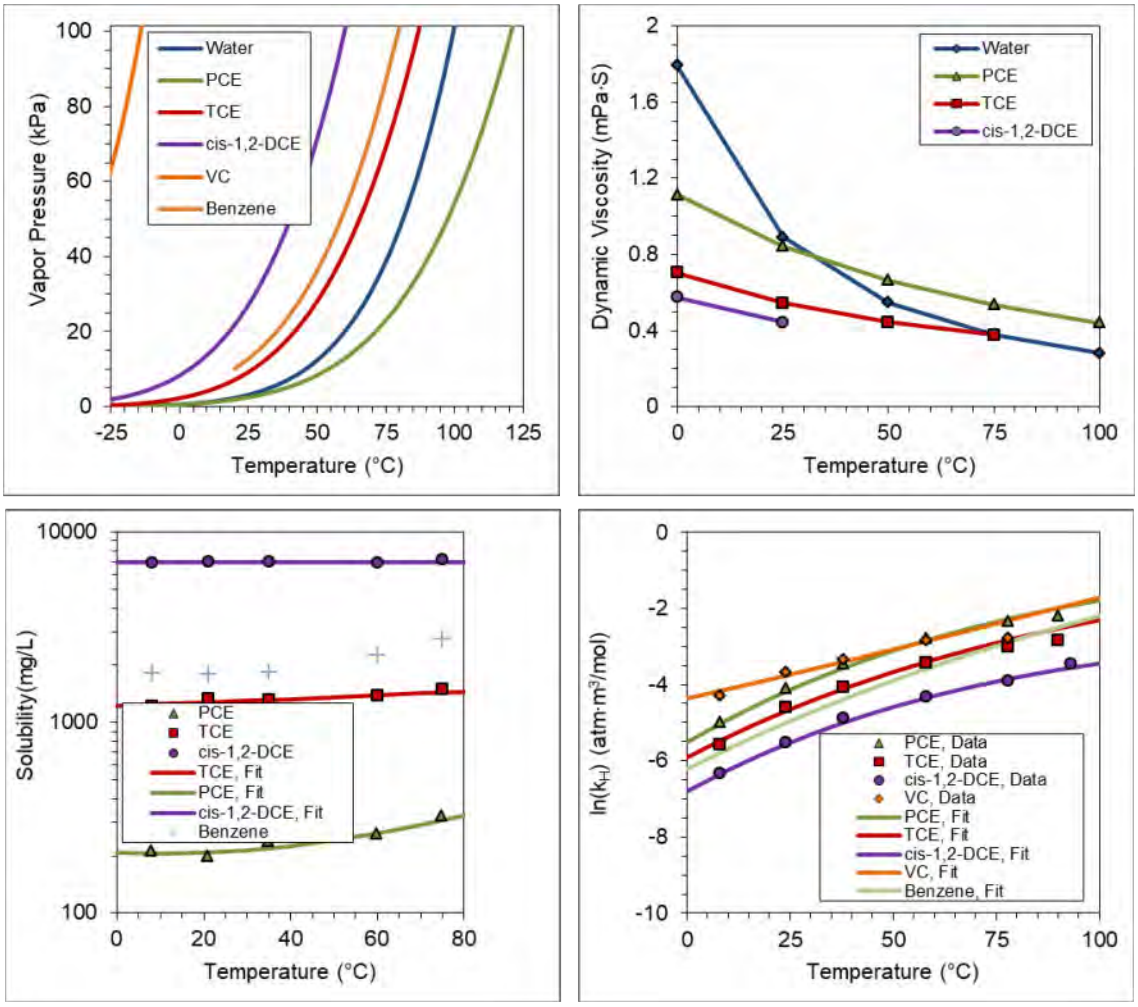

Figure 2: Selected temperature dependent properties of several chlorinated VOCs (data from Chen et al., 2012; NIST, 2016; Haynes et al., 2014)

2.2. SEE Subsurface Vapor Generation

The placement and operation of steam injection and extraction wells are designed such that sufficient temperatures will be achieved to vaporize COCs in the source zone. Vaporization occurs when the total gas pressure, given as the sum of the partial vapor and dissolved gas pressures, exceeds the sum of the ambient atmospheric, hydrostatic and capillary pressures. Consequently, boiling points increase with depth below the water table and vary with lithology.

When NAPL is present, gas production first occurs at the co-boiling (i.e., steam distillation, heteroazeotrope) temperature, as vapor pressures are additive at immiscible fluid interfaces (e.g., Dalton's Law). Fractional distillation theory governs the composition of the vapor phase. Co-boiling continues until all of the NAPL vaporizes, and capture of the resulting vapors can represent a significant amount of the total VOC mass

Table 4: Impact of increased temperatures on partitioning and fate of VOCs in the subsurface (adapted from USEPA, 2004, and others)

Item	At Increased Temperature	Impact on Partitioning or Transport
Vapor Pressure	Increases	Increased vaporization of water and NAPL
Henry's law constant	Increases	Increased volatilization of dissolved VOCs
Solubility in water	Increases	Increased dissolution of NAPL
Soil-water partition coefficient	Decreases	Decreased sorption of VOCs to soils
Liquid density	Decreases	Upwards transport of dissolved VOCs
Liquid viscosity	Decreases	Increased mobility of continuous NAPL
Interfacial tension	Decreases	Increased mobility of discontinuous NAPL
Gas diffusivity	Increases	Increased diffusion of VOC vapors
Liquid diffusivity	Increases	Increased diffusion of dissolved VOCs

For multicomponent NAPL mixtures, the more volatile components vaporize preferentially (e.g., Raoult's Law), and both the composition of the NAPL and the co-boiling temperature change over time (e.g., Zhao et al., 2014). Gas bubbles are generated at NAPL-water interfaces during co-boiling and propagate upwards as buoyancy forces overcome capillary trapping forces. Subsurface heterogeneities in permeability (e.g., Mulholland et al., 2016), resistivity (e.g., Martin et al., 2016), and transient temperature distribution (e.g., Hegele and Mumford, 2014) will influence the path of co-boiled vapor bubbles towards extraction points below the water table.

Pulsed operations can be performed as a strategy to create new gas pathways and remove mass in regions where vapors might be stagnant. This technique involves varying individual steam injection rates and applied vacuums such that regions of the subsurface are repeatedly pressurized and depressurized.

Subsurface temperatures are monitored in real time during an SEE application in order to identify the vapor generation response (i.e., changes in the rate of temperature increase, indicating regions of sensible or latent heat absorption), as well as to inform the operation of the formations response to steam injection, especially where heterogeneities may arise in the formation.

2.3. Subsurface Steam Generation

The placement and operation of the steam injection and the extraction wells are designed so that the treatment area temperature exceeds the minimum required to volatilize the COCs and move them to the extraction points. With benzene being the primary COC at the Site, the minimum temperature is approximately 176.3°F (80.2°C), although this varies with the local pore pressure at any point in the subsurface.

Figure 3 illustrates how steam is formed and how contaminants are extracted using SEE and multiphase extraction. The design is based on numerical models and Mc^2's extensive experience on remediation projects. There are several fundamental elements of SEE that are explained in further detail in this section.

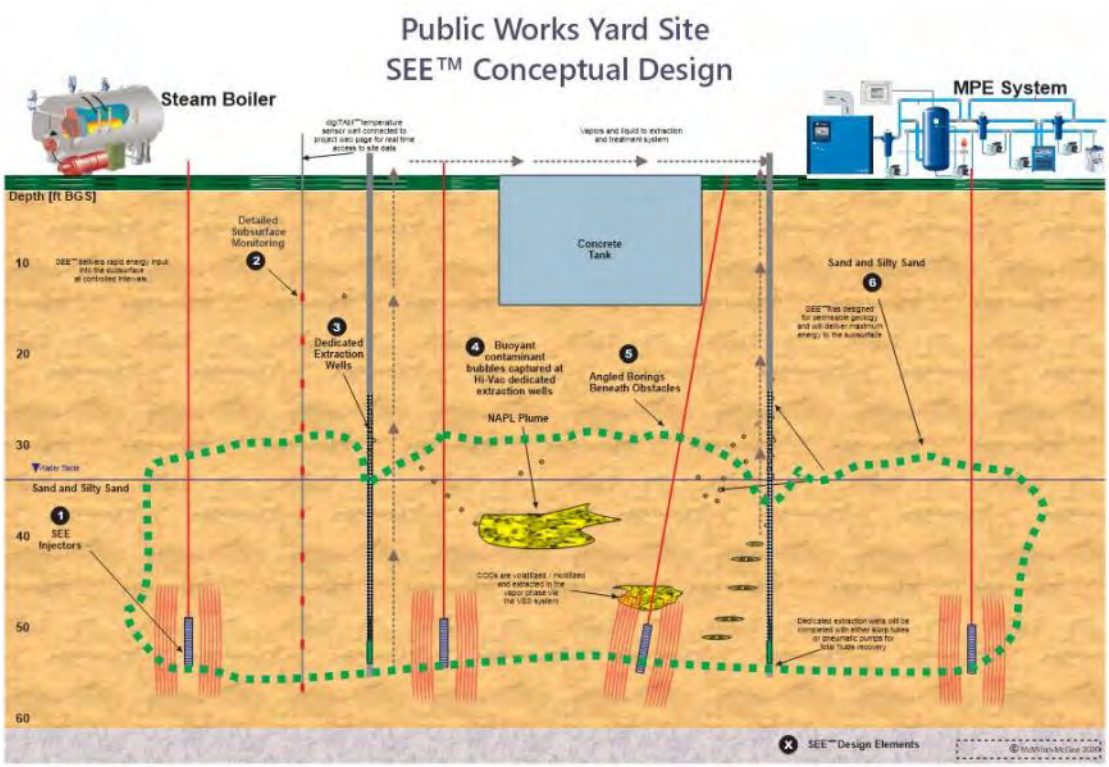

Figure 3: Schematic of technical approach using SEE

Element 1: Steam injection wells will be used in the permeable sand and silty sand layer to deliver heat to the soil within the treatment interval. The temperature increase will increase the volatility of the contaminants present in the treatment zone allowing them to be recovered at the extraction wells. VOC vapors are created at elevated temperatures in the treatment volume. Steam injection will also sweep contamination towards MPE wells used for vapor capture.

Element 2: Continuous remote data monitoring of temperature using digiTAM™ sensors will allow operators to respond in real time to transient subsurface conditions. The data will be available on a dedicated project web page.

Element 3: Dedicated MPE wells are used to capture fluids for aboveground treatment and discharge. Compressed air pneumatic groundwater recovery pumps are operated at sufficient extraction rates to maintain inward gradients for hydraulic control, as steam is injected to the steam injection wells and this steam displaces groundwater, and they also function as a mechanism to capture dissolved VOCs. Continuous operation of the extraction wells at sufficient vacuums will capture vaporized VOCs, soil gas, and steam for pneumatic control.

Element 4: Buoyancy causes the thermodynamically created contaminant bubbles to rise vertically and escape from the heated volume. Continuous operation of the extraction system with appropriate placement of extraction wells will be sufficient to overcome the vertical buoyancy and pull the bubbles into the extraction wells. Sufficient local and macroscopic connection of vapor pockets causes bubble and/or channel flow upwards towards the vadose zone and towards extraction wells for capture.

Element 5: Angle steam injection wells, temperature sensor wells, and MPE wells will be used to target contamination beneath site obstacles ensuring site wide remediation.

Element 6: The hydraulic conductivity corresponding to the sand and silty sand geology of the Site is excellent for steam injection. The average horizontal hydraulic conductivity of 1.24×10^{-2} cm/s is within the recommendations of the EPA for SEE (EPA, 2015).

3. Remedial Approach

Remediation of the target treatment zone will be accomplished by using steam injection combined with MPE technology. The design and application of these technologies is based on fundamental physical principles, lessons learned from previous projects, site-specific characteristics and constraints, and site goals.

3.1. Numerical Simulation

To maximize treatment effectiveness and minimize the potential for condensation and relocation of contaminant mass within and around the treatment zone, it is very important that the temperature of the treated saturated zone and vadose zone be maintained at or above the target temperature of 100°C.

The objective of the simulation study is to develop a subsurface model of the Site. The model is then used to determine the basis for the system design and operating strategy of the treatment system, and to provide design values for the elements typical of an SEE project. The numerical simulation is included as **Appendix B**.

The simulation study was completed based on the September 30, 2021 revision of the design, and has not been updated according to the increase in treatment area, number of steam injection wells, and number of extraction wells. Energy, steam, and extraction rates reported have been updated by scaling up proportionally to the additional number of steam injection wells. All calculations reported in **Appendix C**.

3.1.1. Energy Requirements for Remedial Temperatures

The energy density target for this project is estimated to be approximately 389 kilowatt hour per yard (kWh/yd^3) to achieve the target temperature in the identified heated volume. Heat losses due to boundary conditions and extraction are accounted for. Efficiency of the boiler is not accounted for.

3.2. Remedial Components

The preliminary design for thermal remediation for the Site is provided below.

1. Eighty-one (81) steam injection boreholes (forty-eight [48] in Area A; thirty-three [33] in Area B) with one (1) screen interval per borehole. 2 inch diameter casing and screen used for each injection point;
2. Thirty-six (36) MPE wells (seventeen [17] in Area A; nineteen [19] in Area B). 4 inch diameter MPE wells to allow installation of air-driven groundwater recovery pumps; and,
3. Sixteen (16) vertical sensor wells (ten [10] in Area A; six [6] in Area B]. Area A will have nine (9) and Area B will have five (5) digiTAM™ sensors spaced at 3 foot intervals. The sum total of temperature sensors is one-hundred twenty (120).

A soil and groundwater treatment system, including knockout pots, pumps, holding tanks, bag filters, an air stripper, sacrificial vapor-phase and liquid-phase carbon vessels, vacuum blowers, pumps, heat exchangers, sensors, and controls will be required. To promote efficient re-use of equipment, for environmental reasons, this treatment system will incorporate used components (RTO) owned by the project as well as new equipment being constructed by Mc^2.

The layout of the steam injection boreholes, multiphase extraction wells, and temperature sensor wells has been optimized to minimize the total length of casing/screen and sensor wire used, both for cost, schedule, and environmental reasons.

3.3. Technical Design Summary

Table 5 presents a synopsis of the remediation design for the in-situ thermal heating and thermally enhanced multi-phase extraction system.

Table 5: Project Design Summary

Item	Units	Comments
Site Characteristics		
Heated Area [ft^2]	48,204	Area A – 28,060 ft^2; Area B – 20,144 ft^2
Heated Volume [yd^3]	23,183	Area A – 18,706 yd^3; Area B – 4,476 yd^3
Deep Extent of Treatment [ft BGS]	57/56	Area A/B
Shallow Extent of Treatment [ft BGS]	39/50	Area A/B
Depth to Groundwater [ft BGS]	28 to 37	
Contaminant of Concern	Benzene	
Remedial Goals	Line of Evidence	See Section 1.3
Hydraulic Conductivity (cm/s)	1.2E-2	Horizontal average per AECOM
Remedial Approach		
Steam Injection Wells	81	2 inch diameter, 3 ft long screen, 1 screened interval per boring
Steam Boiler [BHP]	500	150 PSI Design
digiTAM™ Temp. Sensors	120	16 strings, 5 to 9 sensors at 3 ft intervals
Steam Well Spacing [ft]	~30	Conservative design
Minimum Target Temperature [°F]	~176.3	Minimum average in treatment zone required; 80.2°C
Multiphase Extraction Wells	36	4 inch diameter; pneumatic powered pumps; 304SS continuous wire wrapped screen
Vapor Recovery Air Flow [SCFM]	875 to 1,799	Variable depending on phase of project and steam injection rate
Vapor Treatment Method	RTO	Existing regenerative thermal oxidizer with sacrificial carbon backup
Liquid Treatment Method	AS /LGAC	Air Stripper and Liquid Granular Activated Carbon
Summary Information		
Total Energy Input [MWh]	9,027	Steam input only
Power Input [kW]	2,089 to 2,992	Not including treatment equipment. Corresponds to approximately 5,000 to 10,000 lbs/hr total steam injection
Water Demand [GPM]	35	20 GPM maximum for the steam boiler; 15 GPM for the treatment system.
Time to Target Temp. [days]	60-90	
Project Duration [days]	180	Conservative to account for sampling and downtime.

3.4. Subsurface design

3.4.1. Target Zones

The Site is divided into two adjacent TTZs: Areas A and B. The Area A heated area is approximately 28,000 square feet (ft^2) with a treatment interval between 397 and 378 ft amsl; Area B is approximately 20,150 ft^2

with a treatment interval between 395 and 389 ft amsl. The heated area is defined as the area that extends 3 ft beyond the perimeter steam injection well locations. The treatment area is defined as any zone within the perimeter steam injection wells that is within the defined treatment interval for TTZ Area A and B.

3.4.2. Steam Injection Wells

A total of eighty-one (81) steam injection wells will be installed uniformly throughout the treatment volume. Area A will have forty-eight (48) steam injection wells where four (4) of those wells are installed at an angle underneath Building B. Area B will have thirty-one (33) steam injection wells where eight (8) of those wells are installed at an angle underneath the Buckeye pipeline to accommodate a 5 ft drilling offset. The steam injection wells located as shown on the Well Field Layout drawing (**WFL-01**) and constructed as shown on the Well Construction Detail drawing (**WCD-01 and WCD-02**) included in **Appendix A**. Details of the wellhead connections to the steam conveyance network are presented in **WHD-02 (Appendix A).**

Steam injection rates will be adjusted throughout operations and will be dependent on the rate of heating in the subsurface. Once the target temperature is achieved in an area, the steam injection rate will be placed into maintenance mode, in which the steam injection rates are reduced. In maintenance mode, the treatment zone is kept at or above the design temperatures, and mass recovery is maximized.

3.4.3. Multiphase Extraction Wells

Thirty-six (36) MPE wells will be installed at the Site, complete with compressed air assisted vacuum-lift groundwater recovery pumps, placed uniformly throughout the treatment volume. Area A will have seventeen (17) MPE wells where one (1) of those wells are installed at an angle underneath Building B. Area B will have nineteen (19) MPE wells where six (6) of those wells will be installed at an angle underneath Building D.

MPE extraction wells will be installed on 30 to 50 ft centers, similar to the steam injection well locations; however, extraction well locations are restricted to the interior of the treatment areas. They are located primarily in the center of steam injection well triangle arrays to optimize heat transfer through the heated zone by drawing vapor and liquid away from the thermally energized zones to colder areas between the steam injection wells and underneath the buildings.

The total vapor recovery flow will range between 875 and 1,799 SCFM depending on the steam injection rate to the formation. This corresponds to 24 to 50 SCFM per extraction well.

The extraction wells are located configured as shown in **WFL-01** (**Appendix A**) and constructed as shown in the Well Construction Diagram drawing **WCD-01** and **WCD-02** in **Appendix A**. Details of the down hole pump assembly and wellhead connections to the piping network are presented in **WHD-01 (Appendix A).**

3.4.4. Sensor Wells

Sixteen (16) digiTAM™ temperature sensor wells will be used to monitor subsurface temperatures within the treatment volume. These electronic sensors use the three-wire communications protocol and are rated for 125°C. The digiTAMs™ will have sensors vertically spaced approximately at 3 ft intervals, and each sensor string will contain five or nine sensors, depending on the if they are located in Area A or B, for a total of 120 individual temperature monitoring points at the Site. Area A will have ten (10) sensor wells where one (1) of those wells are installed at an angle underneath Building B. Area B will have six (6) steam injection wells where one (1) of those wells will be installed at an angle underneath Building D. Sensors in Area A will be placed at 36 ft BGS, 39 ft BGS, 42 ft BGS, 45 ft BGS, 48 ft BGS, 51 ft BGS, 54 ft BGS, 57 ft BGS, and 60 ft BGS. Sensors in Area B will be placed at 48 ft BGS, 51 ft BGS, 54 ft BGS, 57 ft BGS, and 60 ft BGS.

DigiTAMs™ are integrated with Mc²'s on-Site local area network (LAN) and will be monitored as part of the overall data acquisition strategy for the thermal project. These sensors will be located as shown in **WFL-01** (**Appendix A**) and constructed as shown in the Well Construction Diagram drawing **WCD-01 and WCD-02 (Appendix A)**. Wellhead details are presented in the Well Head Diagram drawing **WHD-01 (Appendix A).**

3.5. Above Ground Design

3.5.1. Extraction System

Compressed air powered groundwater recovery pump assemblies will be used for the extraction of groundwater. The treatment system has been designed to accommodate a peak liquid extraction rate of 40 GPM, with a normal, design extraction rate of 20 GPM. The extraction and treatment system is designed to capture and separate moderate amounts of free-phase product through use of the pumps and a phase separator. It is important to maintain an extraction rate roughly two times greater than that of cold water equivalent steam injection throughout the project to ensure inward hydraulic gradients. Extraction rates at individual MPE wells will vary over the course of thermal treatment, in particular as phase changes and pneumatic fracturing increase the permeability of lower permeability soil encountered (if any).

An air compressor will supply air to each pump at sufficient pressure to overcome the hydrostatic confining forces of the water column at the bottom of the extraction line. Liquid extraction from the MPE wells will be controlled through timer solenoids and isolation ball valves in the well field. Multiple extraction wells will be controlled by a given compressed air solenoid valve. All MPE wells are constructed of 4 inch materials to allow installation of this equipment.

The extraction system will use one high capacity, high vacuum pump (blower) to provide the driving force for vapor extraction and groundwater/soil vapor conveyance through the piping network to the treatment system. The extraction piping layout is shown on figure **PIL-01**

and **EPD-01** in **Appendix A**. This blower will be capable of providing both high-flow, low vacuum, and low-flow, high vacuum conditions using suitable flow control valves and variable frequency drives. The vapor recovery line for vapor extraction piping will connect to the primary liquid/vapor knockout tanks and heat exchangers to capture entrained liquids and condensate before being moved to the vapor treatment side of the treatment system.

3.5.2. Treatment System

The treatment system is designed to process two flow streams; (1) vapors and entrained liquids; and (2) groundwater. A complete process visual presentation and equipment detail of the treatment system can be found in the process flow diagram (PFD) **PFD-01, P&ID-01, P&ID-02, P&ID-03,** and **P&ID-04** (**Appendix A**). The treatment system is subject to amendment with design changes or during operations. The ancillary energy, used for the treatment system and other electrical facilities, is estimated at 841 MWh.

One high-capacity, high-vacuum blower will be used to extract volatilized vapors and liquid from the MPE wells. Extracted liquids and vapors will be piped back to the treatment system via a common header and will first pass through a 5,000 gallon silt/liquid/vapor knockout tank (tank KO-100 shown on **PFD-01** and **P&ID-01** in **Appendix A**) to separate the liquids (i.e. condensate) and entrained sediments from the vapor stream. Vapors will then pass through a shell & tube heat exchanger (HE-120) cooled by cooling tower (CT-130), to reduce the process steam temperature, and then a liquid-vapor separator (KO-140) to extract additional condensate formed due to cooling in the heat exchanger. The vapor stream will be further cooled as it passes through a second shell & tube heat exchanger (HE-160) using a 50% propylene glycol/50% water coolant, which is chilled using a chiller (CH-170), and then a liquid-vapor separator (KO-180) to extract additional condensate formed due to chilling in the heat exchanger. Following liquid removal, vapors will be drawn through two vacuum blowers (B-220A and 220B) which will deliver approximately 900 SCFM under a vacuum of 12 inHg. The vapor stream will pass through a silencer (S-230) and then a fin fan heat exchanger (HE-240) to counteract the temperature increase from the blowers. The vapor stream will then be tied into the RTO. Should the RTO experience an upset condition, vapors will be redirected to two 5,000 lbs sacrificial vapor granular activated carbon vessels (VGAC-270 & VGAC-280). Vapors generated during the air-stripping stage (part of the liquid treatment train) will be tied into the vapor stream following HE-240, prior to vapors being directed to either the RTO or VGAC 270 for treatment.

Extracted groundwater from the MPE wells will be separated in KO-100 and pumped via P-110 to oil-water phase separator (OWS-400). Prior to OWS-400, condensate from KO-140, KO-180, and KO-250 will be pumped via P-150, P-190, and P-260, respectively, to join with liquid being pumped by P-110. Accumulated light NAPL (LNAPL) will be drained into a 250

gallon tank (T2-410) and dense NAPL (DNAPL) (if any) will be periodically drained into 50 gallon barrels for offsite disposal.

Liquids and condensate from the phase separator will be pumped through one air stripper, AS-440 via P-420. Vapor discharge from the air stripper will be passed to KO-250 for treatment by the RTO or VGACs. The process liquid line will then go through three bag filter sets (BF-460A/B/C and BF-470A/B/C) and a shell & tube heat exchanger (HE-480) cooled by a cooling tower (CT-490). The bag filter sets will be designed so that the full process flow can go through one bag filter housing line while the other is being changed.

Liquid discharge from the bag filters will be sent to two 2,000 lbs liquid-phase activated carbon treatment vessels (LGAC-500 and LGAC-510) operated in series. The treated water will be pumped into a final 5,000 gallon equalization tank, from which the water will then be discharged or used for LGAC backwashing.

Combined treated water and treatment equipment discharge will be discharged to the onsite stormwater drain. Treated water discharge to the storm sewer is estimated to be at a rate of up to 50 GPM. The discharge contaminant concentration limits are to be determined; however, the system is designed to be capable of treating the discharge to below drinking water requirements for all organic contaminants. During initial startup, treated water will be analyzed to ensure that concentrations meet permit criteria prior to discharging to the storm sewer.

3.5.2.1. Treatment Flows and Processes

A maximum vapor system flow of approximately 1,800 SCFM, and a design maximum extracted groundwater flow of approximately 50 GPM are the bases for the treatment system design.

Typically, the maximum contaminant mass-loading rate on the extraction system to be expected during a project is approximately 3-4% of the total contaminant mass extracted per day, approximately 95% of which is usually in the vapor phase, and 5% of which is in the liquid (groundwater) phase.

The main rotary blowers (B-220A/B) will provide the driving force behind the MPE system. Each blower is capable of 2,000 SCFM at a vacuum of 12 inHg. This extraction rate will create and maintain inward pressure gradients in the subsurface, assuring pneumatic control. The back-up VGAC vessels are sized to allow approximately 2 to 4 days' operational time at peak mass removal rates before changeout.

Most of the dissolved contamination in the groundwater will be removed by the air stripper prior to entering the LGAC units, which will be used to remove any remaining contamination and to polish the liquid stream. Overall contaminant removal from the liquid stream using the air stripper is expected to be greater than 95%. The percentage of mass that will be removed as dissolved contamination is expected to be less than 5-10% of the total mass. Only approximately 10% of this value (1% of the total

contaminant mass) or less is typically recovered as pure phase NAPL for benzene. The LGAC vessels selected are sized for the instantaneous process flow through them; they are anticipated to only require one changeout at the end of the remediation.

All buildings and tanks will have secondary containment with leak detectors (shown on **P&ID-01** through **P&ID-04**). Tanks and separators will have sensors for flow control and to detect overflow conditions. The typical sensor set points for treatment system tanks are:

- low: which shuts off the discharge pump;
- high: which turns on the discharge pump;
- high-high: which shuts the groundwater recovery off but maintains a minimal vacuum level for pneumatic control ("Yellow Alarm"); and,
- high-high-high: which shuts off groundwater recovery and all vacuum recovery ("Red Alarm").

Tanks containing VOCs or untreated water will be held under vacuum to control fugitive emissions. A line from the primary knockout tank (KO-100) will be connected to treatment tanks through a vacuum regulator and vacuum relief valve, to prevent VOC vapors from escaping. Tanks will also have individual vacuum relief valves as a safety precaution. Additionally, valves, flanges, and pipe joints shall be monitored periodically via use of a handheld photo-ionization detector (PID) during routine inspections to monitor for VOC release.

3.5.3. Steam System

The steam injection system will be fed by a natural gas steam boiler capable of producing 13,800 lbs/hr of steam at 150 pounds per square inch (PSI). The unit is oversized for the current design injection rate of 10,000 lbs/hr. The boiler is contained in a stand-alone inclement weather 53 ft trailer. See **Appendix D** for a cut sheet of the steam boiler unit. The location of the steam boiler is shown on figure **EQL-01** and **EQL-02** in **Appendix A**. The steam piping layout is shown on figure **SPD-01** in **Appendix A**.

The steam injection system will be equipped with eight drip leg and steam trap assemblies, shown in **SPD-02** in **Appendix A**.

The steam injection flow, metering, and sizing calculations can be found in **Appendix B**.

3.5.4. Insulation

All sections of 2 inch and 3 inch steam headers will be insulated with 1 inch thick Owens Corning SSL II with ASJ Max Fiberglas™ pipe insulation jackets to improve energy efficiency and site safety, as shown in **SPD-01** in **Appendix A**. Nowhere else in the injection, extraction, or treatment systems will be insulated

3.5.5. Utility Requirements

3.5.5.1. Electrical

The power requirement will be satisfied by one three-phase service. One transformer will feed one Power Distribution Panel (PDP). This will serve as the main disconnects for the treatment area. The PDP unit will be located in the electrical equipment area, shown on the Equipment Layout Drawing (**EQL-01/02**) in **Appendix A**. A detailed description of the electrical requirements can be found in the Electrical Single Line (ESL) diagrams **ESL-01** (**Appendix A**). See **Appendix D** for the PDP cut sheet.

3.5.5.2. Water

A water usage rate of 10 to 20 GPM for the steam boiler is expected during operations, depending on the operations stage, resulting in a total water requirement for the boiler of 3.3 million gallons and a water extraction total of up to 6.8 million gallons based on an approximate extraction/injection ratio of up to 2.0. Additional water will be required to feed the treatment system cooling processes and will be 5 to 15 GPM depending on the heat load.

3.5.6. Telecommunications

The telecommunications system that will be used is comprised of a LAN in the field for real-time data communications. A high-speed Internet connection with a minimum 500.000 bits per second upload/download speed for off-Site data transfer and remote control of the system by Mc^2 will be installed. On-Site personnel will require cell phones to communicate with Mc^2 project staff.

3.6. Treatment & System Monitoring

Appropriate system controls will be an integral part of the liquid treatment system. The discharge holding tank (T-520) will have a high-high level sensor to shut down the system to prevent an overflow of the tank. Potable water usage will be monitored by use of a flow totalizer. In the case of an overflow, spilled water will collect in secondary containment or sumps, triggering overflow sensors. The knockout tanks and other tanks will feature high and low level switches to control and protect transfer pumps, and prevent downstream overflows. High-high level sensors in these tanks will trigger a “yellow” alarm, shutting down groundwater recovery but maintaining a minimal soil vapor recovery flow. High-high-high sensors will trigger a “red” alarm, shutting down both soil vapor and groundwater recovery. Operations personnel will be alerted of treatment system shutdowns via automated call-out, email, or short message service (SMS) text message to their cell phones.

3.7. Data Management,

3.7.1. Data Management

Digital data obtained from onsite digital measurement devices are transmitted over a LAN to Mc^2's on-site server, which logs all readings and stores them in a local database. All changes to the database are then immediately synced across the Internet to the Calgary, Alberta, Canada office over a secure virtual private network (VPN) tunnel. In Calgary, the data is again replicated to a live backup. Daily snapshots are made of the entire database on both the on-site server and the primary office server, and these snapshots are archived to Mc^2's backup server for disaster recovery. Additionally, every server is protected with redundant hard drives in Redundant Array of Independent Devices (RAID) 1 configuration. In Mc^2's Calgary office, a dedicated server room has backup power and redundant internet lines to ensure reliable service for all active projects. Occasional scheduled outages are required for server maintenance and upgrades.

In the event of catastrophic Internet failure, the data is fail-safe stored in both Calgary and onsite servers. The onsite server will store all new information until a new connection is made, and will maintain the normal operating conditions. All alarm controls will continue to function (preventing system overflow, etc.). Site personnel will be immediately notified if the Calgary server loses contact with the on-Site server.

Where automated readings are taken more than once an hour, data is summarized hourly, and the individual readings are removed from the database after 5 days. The logs are kept for the duration of the project, so that individual readings could still be reviewed after the 5-day retention period if necessary, but it should be noted that these log files are not backed up off-site.

Data entered manually by the Site operators via our project website is protected in the same way as the automated readings, except that no copy is made back to the on-site server.

3.8. Sampling and Analysis

3.8.1. Liquid Samples

Liquid samples will be collected once every two weeks. The following four locations will be sampled at every sampling event:

- Immediately upstream of the air stripper, at the outlet of the OWS unit (OWS-400). These concentrations will be used to calculate dissolved-phase contaminant mass removal from the subsurface; and,
- Downstream of the air stripper (AS-440);
- Immediately downstream of LGAC-500; and
- Immediately downstream of LGAC-510.

Liquid samples may also be collected at additional locations to evaluate individual treatment vessel efficiency and media consumption or breakthrough, but are not mandatory (contrary to those shown above). Liquid samples will be submitted to a commercial laboratory for characterization.

3.8.2. Vapor Samples

Mc^2 will collect two vapor samples on a bi-weekly frequency for laboratory analysis/confirmation (USEPA Method TO-15 or equivalent, with a Tedlar™ bag or Summa sample container) and daily for analysis using a PID. These samples will be collected immediately after the blower, before and after addition of the air stripper air. The lab results will be used to confirm PID results and to provide a more quantitative assessment of mass removal rates. The PID measurements will be corroborated with analytical vapor measurements by taking a reading from a sample collected in a Tedlar™ bag prior to shipping the sample to the laboratory, and by daily calibration using certified calibration gas.

In addition to the above discrete sample events, the Site operator will have a portable PID to monitor the treatment area and equipment intermittently to check for leaks and fugitive emissions.

3.9. Mass Recovery

The field data collected with the PID and confirmatory laboratory data will be used to record daily concentration levels in both phases. Totalizers in liquid streams will provide a volumetric record of liquids extracted and processed, while rotameters and pitot tubes will provide an instantaneous volumetric rate of vapor flow. Liquid and vapor measurements will be recorded at a minimum of 5 times per week (subject to operator scheduling). Mass removal in both liquid and vapor streams is calculated by multiplying concentration and flow calculated/recorded for the period immediately before the concentration reading. Daily and cumulative mass removed data will be displayed on the project's secure web page both in tabular and graphical format.

4. Construction Activities

Field construction include the installation and/or performance of:

1. Steam injection wells;
2. MPE wells;
3. Sensor (digiTAM™) wells;
4. Steam boiler and treatment system equipment;
5. Treatment system piping and RTO integration
6. Steam injection piping and insulation;
7. Connecting steam injection lines and setting up metering;
8. The header connection to the treatment system skid;
9. Potable water connection;
10. Sewer connection;
11. Power connections to the treatment system;
12. Power and gas connections steam boiler;
13. System acceptance testing; and,
14. Wet testing the treatment system prior to startup.

4.1. Staging Equipment & Supplies

All equipment and supplies used during the construction of the treatment system will be staged in a secure manner. The treatment system will be located within a secured area.

The location of the soil vapor and groundwater treatment system is an approximate area of 5,500 ft^2, as shown in **EQL-01/02** (**Appendix A**). VGAC and LGAC vessels will be placed outside so as to be accessible for changeouts. The placement of the steam boiler unit is shown on this figure as well.

Equipment will be placed in a manner to minimize hose and wire runs. The PDP will be placed as close as possible to the Site transformer. Equipment cut sheets can be found in **Appendix D**.

4.2. Subsurface Construction

4.2.1. Site Security

Prior to construction and operations, the existing fence should be modified with privacy slats. Equipment will be stored either in a locked container, or in an area deemed safe by AECOM. “Hot Surface” signs will be hung Site wide.

4.2.2. Utilities

The treatment area has existing subsurface sewer, stormwater, and electrical utility lines. The existence of these utilities, in addition to others which may be unknown, requires additional caution be undertaken during

the subsurface construction planning, and may require hand clearing to the maximum extent possible to ensure that no utilities are encountered during drilling and construction activities. The final locations of all subsurface installations were subject to the location of existing utilities, resulting in some modifications to the steam injection well grid.

All necessary authorities are to be consulted in advance of the drilling phase to obtain permits and utility mark outs. Drilling activities incorporate safety measures such as soft digging to prevent damaging underground utilities and structures.

All polyvinyl chloride (PVC) pipes located in the treatment area above the target interval are subject to deformation as a result of operations. These are understood to be abandoned in place.

4.2.3. Drilling Program details

The preferred methods of subgrade installation are sonic drilling. These drilling methods provide excellent production, make for easy installation, and have proven results for large and deep well arrays. **Table 6** details the volumes of investigative derived waste generated during the proposed subsurface installation program.

Table 6: Drilling Program Details

Item	Qty	Depth (ft)	Angle (deg.)	Length (ft)	Diameter (ft)	Volume (ft^3)	Notes
Steam Injection Wells	44	57.0	0.0	57.0	0.33	218.9	Area A
	25	57.0	0.0	57.0	0.33	124.4	Area B
	4	57.0	15.1	59.1	0.33	19.9	Area A Slanted
	8	57.0	7.6	57.5	0.33	39.0	Area B Slanted
MPE Wells	16	59.0	0.0	59.0	0.67	329.5	Area A
	14	59.0	0.0	59.0	0.67	288.3	Area B
	1	59.0	12.2	60.4	0.67	20.6	Area A Slanted
	5	59.0	17.6	61.9	0.67	103.0	Area B Slanted
Sensor Wells	9	60.0	0.0	60.0	0.33	47.1	Area A
	5	60.0	0.0	60.0	0.33	26.2	Area B
	1	60.0	14.9	62.1	0.33	5.2	Area A Slanted
	1	60.0	13.0	61.6	0.33	5.2	Area B Slanted
Contingency						**1.3**	
Total	**133**					**1595.5**	**cubic feet**
						59.1	**cubic yards**
						106.4	**tons**

*Notes: Soil volumes are estimates only. Actual waste from these boreholes may be overestimated. Assumptions: 1.8 tons/yd3 wet soil density, 4 inch steam injection well boring, 8 inch extraction well boring, and 4 inch sensor well boring. Angles are averages.

4.2.4. Steam Injection Wells

The steam injection wells will each consist of a 2 inch diameter; 0.010 inch slotted 304 stainless steel (SS) screen. The screened interval is from 54 to 57 ft BGS in both Area A and B. A filter pack consisting of graded sand (20/40 silica sand or equivalent) will be installed in the annular space around the well screen. The boring plug will be completed with a grout (no bentonite) and fine sand seal to surface. Each well will be completed with

an adapter and wellhead and will then be piped to the steam boiler. Each wellhead will have a temperature gauge, orifice plate meter, and a low and high pressure gauge, and a sample port/relief valve. See **WFL-01** (**Appendix A**) for the well field layout and **WCD-01**, **WCD-02**, and **WCD-03** (**Appendix A**) for the steam well construction drawings.

For well head details, please refer to **WHD-02** (**Appendix A**) for the wellhead design.

4.2.5. Extraction Wells

The MPE well boreholes will be 4 inch in diameter and consist of a continuous wire wrap 0.010 inch slotted 304L stainless steel (SS) screen. Above the screen interval there will be a carbon steel riser, the top of which will be complete with a 4 inch, as appropriate, male National Pipe Thread (mNPT) fitting. A filter pack consisting of 20/40 silica sand (or equivalent) will be installed in the annular space around the MPE well screen. The boring will then be finished to surface with neat Type I/II cement grout (no bentonite), able to withstand elevated temperatures. Each MPE well will be completed with a wellhead, which will be connected, via Parker series 7373T Blue Thunder corrugated chemical suction hose, to a conveyance piping network leading to the treatment system. MPE well layout can be found in **WFL-01** (**Appendix A**) and the well designs are detailed in drawing **WCD-01, WCD-02, and WCD-03** (**Appendix A**). The MPE wells will each be equipped with an approximate 1/2 inch inside diameter (ID) polytetrafluoroethene (PTFE) downhole compressed liquid pump recovery line. The compressed air line will be a 1/4 inch outer diameter (OD) PTFE tube. Vacuum blowers B-107A/B will apply vacuum to the MPE wellhead in the above ground treatment system. Each MPE wellhead will be equipped with a temperature gauge, a vacuum gauge, and a sample port/bleeder valve. Detailed wellhead and pump design drawings are presented in drawing **WHD-01** (**Appendix A**). See **Appendix B** for filter pack design calculations.

4.2.6. Sensor Wells

Installation of vertically spaced digiTAM^{TM} sensors will be performed in conjunction with the installation of the steam injection and extraction wells. A string of electronic sensors at 3 ft depth intervals, will be housed in a watertight 1.5 inch carbon steel casing with coated threads for a water tight seal. The digiTAM^{TM} sensors record temperature at their respective depths.

Grout will be used to fill the annular space around the carbon steel casings to surface. The sensor well completion designs can be found in **WCD-01, WCD-02, and WCD-03** (**Appendix A**). A detailed description of the sensor wellheads can be found in **WHD-01** (**Appendix A**).

An Ethernet cable will be connected to the sensor string and brought back to one of three remote boxes for real-time temperature monitoring. This data will serve for daily system optimization.

4.3. Above Ground Construction

4.3.1. Conveyance Systems

4.3.1.1. Extraction Piping

After completing the installation of all subgrade components of the system, the extraction system piping will be installed and connected to the extraction wellheads. The lateral connection for each extraction wellhead above surface to the header will be high temperature vacuum hose, 1.5 inch in diameter. Each connection point of the main header will have a 1.5 inch ball valve to adjust the vapor flow rate and isolate the well from the extraction system when necessary. The main header piping for the extraction system will have a 4 to 8 inch diameter schedule 40/20 carbon steel pipe that will run to the treatment system. Lateral piping throughout the well field will consist of 2 to 4 inch schedule 40/20 carbon steel pipe and will be laid out in a fashion to reduce the length of pipe runs. A 1 inch flex hose will run under the multiphase piping to convey compressed air for the pneumatic pump assembly.

Air lines for the pump assemblies will be supplied by a dry rotary fan air compressor (oil-free) in the treatment system. An air regulator will be placed in the field to manage well field air pressure.

All extraction system piping is to be sloped at a slight grade toward the treatment system for gravity draining. In Area A, the extraction system piping is to be sloped at a slight grade towards the pump station for gravity draining. The wellheads will be connected to the extraction header with hoses using cam-lock fittings. The extraction header piping will rest on pipe stands.

A layout of the extraction piping can be found in **PIL-01** and **EPD-01**, (**Appendix A**).

4.3.1.2. Steam Piping

Concurrent to the installation of the extraction system piping, the steam injection piping will be installed and connected to the steam well metering well heads and the steam boiler. The lateral connection for each steam well head to the main conveyance piping will be steam hose, 1 inch in diameter. Each connection point of the main header will have a 1 inch ball valve to adjust the flow rate and isolate the well from the steam system when necessary. The main header piping for the extraction system will have a 2 inch to 3 inch diameter schedule 40 carbon steel pipe that will run to the steam boiler in the equipment staging area.

The steam piping system has been designed to supply each steam injection well at a maximum of flow rate of 180 lbs/hr (10,000 lbs/hr total system capacity) at no more than 150 PSI, regulated down to 10 to 30 PSI down hole.

The estimated fracture pressure of the formation ranges from 23.7 to 36.4 PSI in Area A and 30.4 to 36.4 PSI in Area B. Formation fracture is

unlikely to occur as excessive pressure build up will most likely result in steam routing up the side of the steam well grout to surface. To reduce the risk of compromising steam injection wells due to over pressuring, pressure ramp up will be slow and closely monitored. Steam pressure and flow rate will be measured at the wellheads to ensure than flow increases proportionally to pressure.

The steam piping will be insulated with 1 inch thickness fiberglass insulation. The steam piping will be fitted with drip leg and steam trap assemblies.

A layout of the steam piping can be found in **PIL-01** and **SPD-01** (**Appendix A**). Details for the drip leg and steam trap assemblies can be found in **SPD-02** (**Appendix A**).

4.3.2. Power Supply

A detailed description of the power supply connections and specifications can be found in **ESL-01** (**Appendix A**). The power drop and electrical connection is provided by TBD.

4.3.3. Treatment System

The liquid treatment system equipment will be skid-mounted with secondary containment in the skid. This secondary containment will have a high level sensor in the holding tank to shut down the system if a leak is detected. Additionally, all transfer hoses with unprocessed liquids will be double contained (primary with sleeve).

Once the treatment system is set up at its designated location, a short section pipe will be installed from the completion of the extraction system header to the primary liquid/vapor separator (KO-100). The treatment system equipment will arrive with the controls described earlier pre-installed.

After completing all piping connections, the liquid treatment system will be pressure tested at 15 PSI for 30 minutes. Additionally, a wet test of the treatment system will be completed prior to startup. Pressure testing is conducted to check for treatment system leaks. The treatment system will be tested with air and water as applicable in order to ensure the integrity of gaskets, valve seals, etc.

4.4. Waste Management

Drilling waste generated during construction activities will be appropriately containerized for on-Site storage prior to off-Site disposal. All waste disposal will be in accordance with applicable regulations and disposal facility requirements.

4.5. System Shutdown and Site Restoration

Once site data indicate that contaminant reduction remedial goals have been achieved, the SEE system will be shut down. Groundwater and soil vapor recovery may optionally continue for a period to maintain hydraulic and pneumatic control of subsurface conditions, if warranted.

Once confirmation sampling has occurred, results have been positively analyzed for successful achievement of the statistical metric for project completion, and the system has been shut down, all above-grade equipment will be removed from the site. The tie in to the RTO system will be capped off and all thermal system components will be removed. Wellheads will be removed, and piping and cables recovered. Extraction and temperature wells will be properly abandoned, as per local regulatory requirements. All well abandonments will be completed by a contractor licensed or authorized to do so in Illinois.

5. Operational Strategy

5.1. Operations and Maintenance Plan

The operational schedule for the anticipated stages of initial heating, maintaining target temperatures, pressure cycling and cool down will be described in the **Operations and Maintenance** (O&M) **Plan** (submitted under separate cover). The O&M Plan will also contain details regarding start-up procedures, operations and maintenance procedures, alarm response, and job hazard analyses.

5.2. Pneumatic and Hydraulic Control

Controlling potential migration and/or redistribution of COCs will be achieved by maintaining sufficient vacuum and extraction within the treatment volume. Pneumatic and hydraulic control will be established and maintained through the extraction of subsurface fluids at design rates, and monitored throughout the SEE application with pressure sensors and flow totalizers. An extraction/injection ratio maintained above unity is used to prevent the thermal system from mobilizing contamination outside the treatment volume due to remedial activities. Groundwater table elevations can be measured at the extraction wells using a water level tape while the steam system turned off to assess hydraulic gradients within the treatment volume for additional verification.

To ensure that short circuiting is not occurring in the vapor capture system, (resulting from one well pulling the majority of the extraction volumes through a cracked vapor cap for example), each well head vapor flow rate will be periodically monitored with an attachable pitot tube assembly. The pitot assembly consists of a pipe spool fitted on the end with camlock fittings compatible with those depicted in drawing WHD-01, and a threadolet fitted with a pitot tube. This allows the Mc^2 project team to adjust the well's extraction rate by opening/closing the ball valve on the 1 inch line connecting the well to the manifold. This balancing of the well field occurs on a weekly basis during start-up, and once a suitable confidence level has been achieved (after stable operations), the frequency of this testing can be reduced. This will permit extraction rates near the East Eighth Street to be verified, and will demonstrate the inward pressure gradients are being created. Cumulative liquid and vapor flow rates, and individual extraction well temperatures and vacuum are also monitored manually on at a minimum of 5 times per week (based on operator scheduling) by the onsite technician. These data, and all other measurements will be made available through the secure webpage for remote monitoring by Mc^2 and AECOM project staff.

5.3. Aggressive Heating and Extraction

After flow rates are adjusted to establish pneumatic and hydraulic control, steam flow rates will be increased to the design range. Steam flow rates will be adjusted based on operator measurements and real-time temperature measurements. Extraction wells will be operated under applied vacuum, and based on vapor, temperature, vacuum, pitot tube and PID measurements at the wellheads, optimized to maximize the capture of VOC vapors. Liquid extraction rates will be adjusted to minimize

convective heat losses associated with extraction, while ensuring the capture of NAPL and dissolved VOCs.

5.4. Upset Conditions

The treatment system programmable logic controller will monitor for a variety of upset conditions, including leaks and overflows, high liquid levels, high temperatures, and vacuum and/or pressure levels out of normal range. Alarms based on high liquid levels will be first trigger a "yellow" alarm condition, which will halt groundwater extraction and lower the vacuum extraction by 50%, to allow the high liquid level to clear through normal equipment operation. Higher liquid levels, or sensor signals that indicate a leak or overflow condition, will trigger a "red" alarm condition, which shuts down all equipment. All main process stream units will have redundant red alarm sensors. Red alarm conditions will require on-site operator intervention.

Treatment system states will be communicated between our treatment equipment and the RTO through dry contact switches and signal wire, and/or MODBUS communications protocol. The Mc2 treatment system PLC will have defined alarm states communicated through MODBUS to the site computer server, which in turn will relays alarms to the Calgary data center server. The Calgary data center server sends e-mail alerts as well as text alerts using the Signal secure communications app. Site operations staff as well as Mc^2 engineering staff will have smartphones so as to be able to receive both e-mail and Signal text alerts. As a back-up, voice call alerts will be made directly from the site computer server for red alarm conditions.

The treatment system controls and communications equipment will have uninterruptable power supply (UPS) backup power, so that monitoring and alerts will continue in the case of a site power outage. Loss of the internet connection to our Calgary server is itself an alarm condition requiring operator intervention.

The on-duty operator will respond within two hours to system alarms. Lone worker protocols will be followed if the operator goes to the site unaccompanied.

5.5. Performance Evaluation and Shutdown

Continued monitoring throughout operations will inform project personnel of system performance and the achievement of shutdown criterion. Please refer to **Section 1.3** for a complete description of the goals of the project and the methods used for determining achievement of those goals.

5.6. Health & Safety

Health and safety will be of paramount concern during all phases of this thermal remediation project. Mc^2 has prepared a **Health & Safety Plan** that will be submitted under a different cover to complement AECOM's Health and Safety Plan, which will include provisions for strict adherence to safety standards and controls during drilling, construction, operations and demobilization. This will ensure that the potential for exposure of

personnel to hazards and unsafe conditions is minimized. To protect the public who may not have access to the Health & Safety Plan, appropriate signage will be placed throughout the entire treatment zone including clearly labeled ‘High Temperature’ signs (in the appropriate language) on all walls, posts and structures visible from the treatment area. Hot surfaces and all process tanks will be appropriately labeled and placarded.

6. Performance Monitoring

Performance monitoring will include monitoring of the extraction system and treatment system parameters, SEE parameters, and subsurface temperature.

6.1. Subsurface Monitoring

Continuous monitoring of Site operations will be conducted to ensure that hydraulic and vapor capture are maintained, over-pressurization is prevented, and operational temperatures are achieved and maintained. Vapor pressure gradients will be determined by manually measuring the vadose zone pressure at extraction wells weekly.

Temperature monitoring will be achieved with 120 digtiTAM™ temperature sensors in 16 boreholes. This high density of temperature data will be logged in a database and used to visualize subsurface conditions in thermal images as shown in **Figure 4**. Since the vadose zone can be approximated by a saturated steam system under operating conditions, pressure in this zone will be a function of temperature (and vice-versa). This allows for interpretation of temperature data to provide supplementary pressure data.

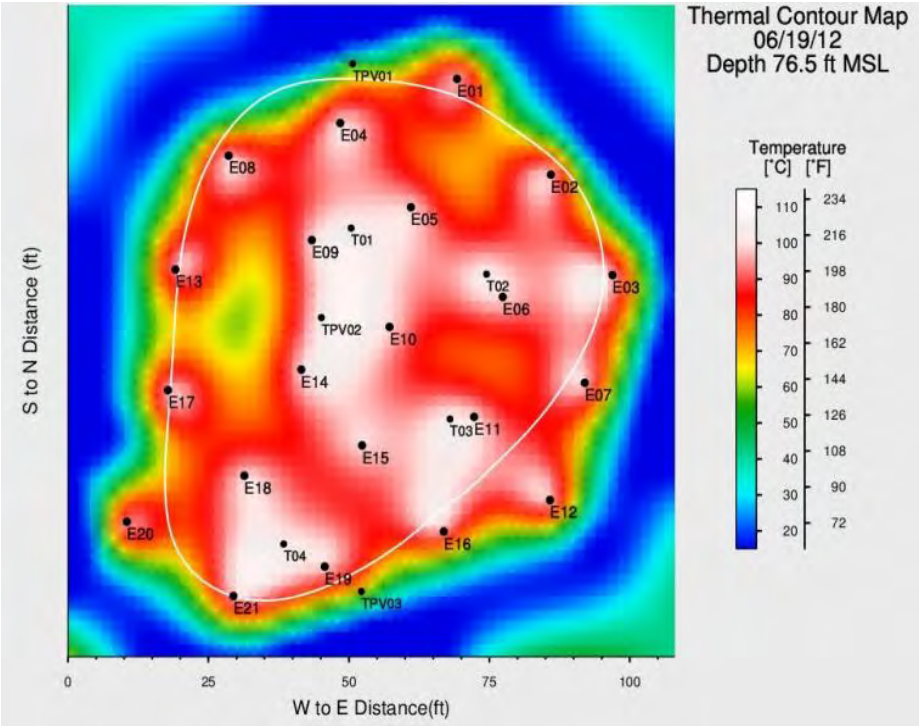

Figure 4: Sample Subsurface Temperature Distribution Map

6.2. Treatment System Monitoring

During operations, on-Site personnel will monitor the remediation system. Site monitoring activities will be conducted at least once per day on weekdays.

Upon completion of each Site-monitoring round, the information will be compiled into an ongoing project database. Contaminant mass removed from soil, volume of liquid removed, system runtime, and subsurface airflow rates will be calculated manually using PID measurements, laboratory analytical results, and flow measurements taken over a specific period.

6.3. Temperature and Vacuum Monitoring

Subsurface temperatures and vacuum in the treatment volume will be monitored from the digiTAM™ and extraction wells, respectively. Vacuum will be measured manually at each vapor extraction point and recorded on the project database. Pitot tube measurements will allow system balancing to prevent short-circuiting.

6.4. Post-Treatment Sampling

Once asymptotic conditions and temperature goals have been reached, post-treatment soil sampling will be performed to assess contaminant mass reduction. Post treatment sampling will follow the sampling instructions and job safety analysis provided in the Health and Safety Plan.

6.5. Data Collection & Management

The following section describes some additional data management and display features that will be used during the thermal remediation of the Site.

Electronic data collection consists of state-of-the-art techniques that have been proven at numerous thermal remediation projects. Data from uniquely addressed digital temperature sensors located throughout the well field and treatment area are transmitted via a communication protocol to an on-Site server. This server's database functions as the first storage location for the collected data. This server also acts as the conduit for real-time sensor data transfer to the Mc^2 central server located offsite. All data is transferred between the on-Site Mc^2 server and the central off-Site server over a secure internet connection. The central server provides redundant storage of all data and provides immediate access to data as required.

The Mc^2 central server is responsible for three main tasks. The first task is to collect and store a complete copy of the database located on-Site. Second, it provides access to all relevant data and operational information gathered from all aspects of the project on a secure database. Third, it is used to calculate and render models of the thermal process and process real-time data for visual presentation. The database may be remotely accessed via the Internet.

7. Conclusion

SEE will be used to target the site for thermal remediation of the VOCs present. Background information of the site and the remedial approach were presented. A summary of the technical design was presented in Table 5, and includes:

1. Eighty-one (81) steam injection wells;
2. Thirty-six (36) MPE wells;
3. Sixteen (16) digiTAM™ temperature monitoring locations with 120 sensors;
4. An expected investigation derived waste volume of approximately 57 yd^3;
5. A conservative estimated total energy input delivered through the steam wells of 9,027 MWh;
6. The estimated ancillary energy used for the treatment plant and other electrical facilities, based on previous site experience, is 841 MWh;
7. A target vapor extraction rate of 875 to 1,799 SCFM; and
8. Total CWE liquid injection and extraction rates of 10-20 GPM and 20-40 GPM, respectively.

A summary of the drilling program, construction details, operational strategy, and performance monitoring plan for the system and were presented, the latter of which includes:

1. Steam injection rates;
2. Subsurface temperatures;
3. Extraction well vacuum and temperature;
4. Water injection and extraction rate; and
5. Vapor extraction rate.

These data will be used to inform the operation of the system, and will be available on a secure project website for remote monitoring. Achieving the design temperature and asymptotic conditions will be used as a metric to assess SEE shutdown, and post-treatment soil and groundwater sampling will be used to confirm progress towards cleanup goals.

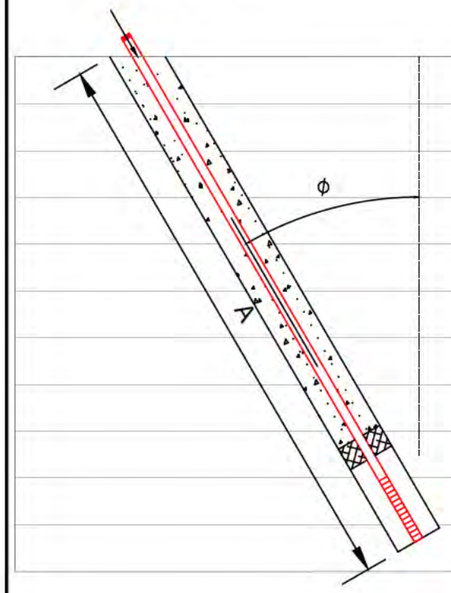
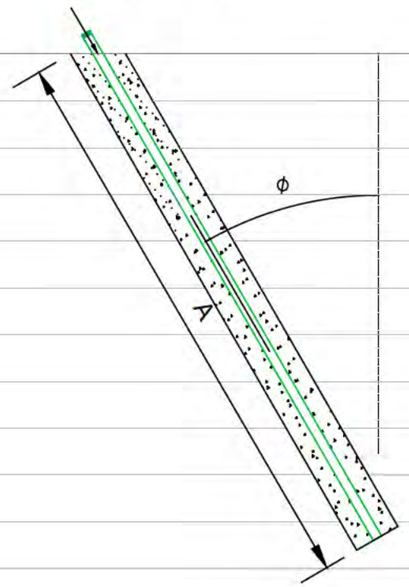
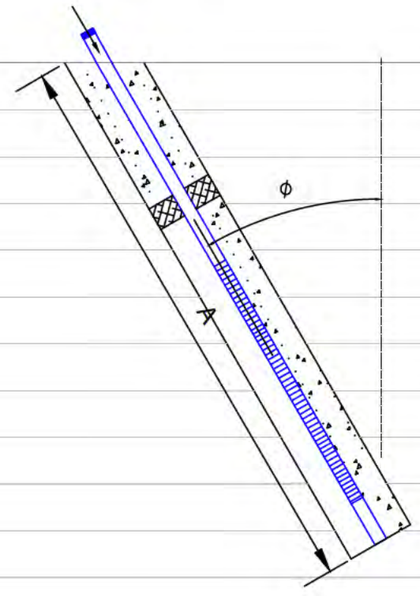
ANGLED
STEAM INJECTION WELL
QUANTITY - 12



ANGLED DIGITAM™
TEMPERATURE SENSOR
WELL
QUANTITY - 2



ANGLED MULTIPHASE
EXTRACTION WELL
QUANTITY - 6



GENERAL NOTES:

1. MATERIAL TYPES
   - A. GROUT
     - HIGH TEMPERATURE PORTLAND TYPE 1 OR EQUIVALENT (NO BENTONITE)
   - B. SAND
     - FINE SAND SEAL: 40/60 SILICA SAND
     - STEAM INJECTION/EXTRACTION WELLS: 20/40 SILICA SAND
2. STEAM INJECTION WELLS
   - A. MINIMUM 4" DIAMETER BOREHOLE
   - B. 2" SCHEDULE 40 CARBON STEEL CASING
   - C. NOMINAL 2" DIAMETER WIRE-WRAPPED 304 STAINLESS STEEL 0.010"-SLOTTED SCREEN
3. TEMPERATURE WELLS
   - A. MINIMUM 4" DIAMETER BOREHOLE
   - B. 1.5" SCHEDULE 40 CARBON STEEL CASING
   - C. THREADS CAN BE NPT OR FLUSH JOINT
   - D. STICKUP MUST BE MALE NPT
   - E. ALL JOINTS TO BE TIGHTENED WITH PIPE WRENCH USING PIPE THREAD COMPOUND AND PTFE TAPE
4. MULTIPHASE EXTRACTION WELLS
   - A. MINIMUM 8" DIAMETER BOREHOLE
   - B. 4" SCHEDULE 40 CASING
   - C. NOMINAL 4" DIAMETER WIRE-WRAPPED 304 STAINLESS STEEL 0.010''-SLOTTED SCREEN
   - D. FITTINGS BETWEEN PIPE SECTIONS ARE 4 THREAD PER INCH (TPI) FLUSH THREADED UNLESS SPECIFIED OTHERWISE (IE M NPT OR PLUG)
   - E. 4" NPT FEMALE X WELD PLATE ENDS

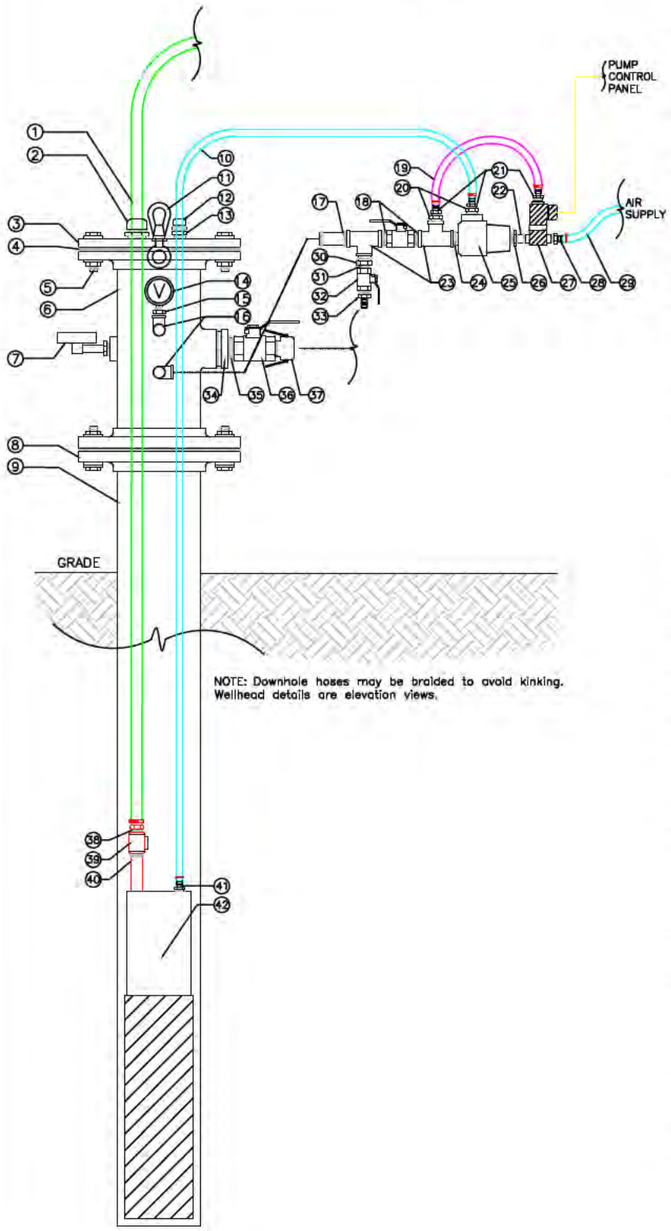
MULTIPHASE EXTRACTION WELL WITH DOWNHOLE PUMP

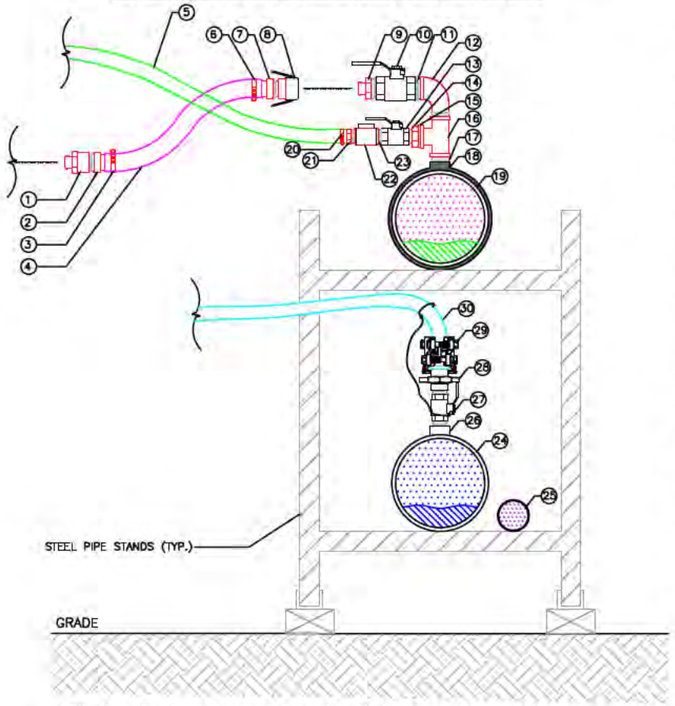


NOTE: Downhole hoses may be braided to avoid kinking. Wellhead details are elevation views.

WELLHEAD COMPONENTS

1. 1/2" ID PTFE GROUNDWATER EXTRACTION LINE
2. 1/2" X 3/4" M NPT CORD GRIP, PVDF
3. 4" ø 150# WELL COVER PLATE, STEEL
4. 4" ø 150# X 1/8" GASKET, VITON (TYP.)
5. 5/8" BOLT, LOCK WASHER & HEX NUT, ZINC (TYP.)
6. 4" ø Mc² WELLHEAD X 150# FLANGE ENDS, STEEL
7. TEMPERATURE GAUGE 0–250°F X 1/2" M NPT
8. 4" ø 150# FLANGE X 4" F NPT, STEEL
9. 4" ø M NPT RISER STICKUP, CARBON STEEL
10. 1/4" ID PTFE COMPRESSED AIR HOSE
11. 1/2" LIFTING EYE ASSEMBLY, WITH GASKET
12. 3/8" X 1/2" M NPT CORD GRIP, PVDF
13. 3/4" M NPT X 1/2" F NPT BUSHING, GALV.
14. VACUUM GAUGE, 0–30" HG X 1/4" M NPT
15. 1/2" M NPT X 1/4" F NPT BUSHING, BRASS
16. 1/2" NPT STREET ELBOW, BRASS
17. 1/2" X 3" NIPPLE, GALV.
18. 1/2" NPT CLOSE NIPPLE, GALV.
19. 1/4" ID ORTAC VENT HOSE
20. 1/2" M NPT X 1/4" F NPT BUSHING, BRASS
21. 1/4" M NPT X 1/4" HOSE BARB, BRASS
22. 1/4" X 3" NIPPLE, GALV.
23. 1/2" NPT PIPE TEE, GALV.
24. 1/2" NPT CLOSE NIPPLE, GALV.
25. 1/2" SUPER QUICK EXHAUST VALVE
26. 1/2" M NPT X 1/4" F NPT BUSHING, BRASS
27. 1/4" 3–WAY SOLENOID VALVE
28. 1/4" M NPT X 1/4" HOSE BARB, BRASS
29. 1/4" ID ORTAC COMPRESSED AIR HOSE
30. 1/2" M NPT X 3/8" F NPT BUSHING, GALV.
31. 3/8" NPT CLOSE NIPPLE, BRASS
32. 3/8" NPT BALL VALVE, BRASS
33. 3/8" M NPT X 1/4" HOSE BARB, BRASS
34. 2" M NPT X 1–1/2" F NPT REDUCER BUSHING, GALV.
35. 1–1/2" NPT CLOSE NIPPLE, GALV.
36. 1–1/2" NPT BALL VALVE, BRASS
37. 1–1/2" M NPT X 1–1/2" FEMALE CAMLOCK (PART B), ALUM. ALLOY
38. 1/2" M NPT X 3/4" HOSE BARB, BRASS
39. 3/4" SWING CHECK VALVE, BRASS
40. 3/4" X 6" NIPPLE, GALV.
41. 1/4" M NPT X 1/4" HOSE BARB, BRASS
42. PNEUMATIC PUMP WITH TOP–LOADING CUP ADAPTER

MULTIPHASE EXTRACTION WELL CONNECTION TO CONVEYANCE PIPING NETWORK

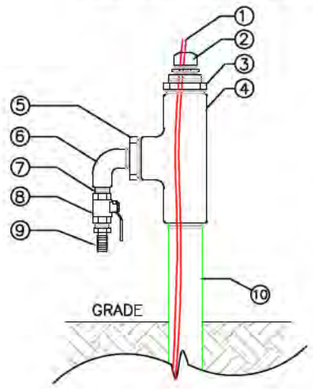


NOTE: Main conveyance pipe is interconnected with dresser couplings and sloped at approximately 1 degree from horizontal towards the inlet of the treatment system. Multiphase flow regime may not be as illustrated. Details are elevation views.

PIPING CONNECTION COMPONENTS

1. 1–1/2" M CAMLOCK TO 1–1/2" F NPT (PART A), ALUM. ALLOY
2. 1–1/2" M NPT TO X 1–1/2" HOSE BARB
3. 1–1/2" HOSE CLAMP
4. 1–1/2" ID PARKER SERIES 7373T BLUE THUNDER CORRUGATED CHEMICAL SUCTION VAPOR EXTRACTION HOSE
5. 1/2 " ID PTFE GROUNDWATER EXTRACTION HOSE
6. 1–1/2" HOSE CLAMP
7. 1–1/2" HOSE BARB X 1–1/2" M NPT
8. 1–1/2" F NPT X 1–1/2" F CAMLOCK (PART D), ALUM. ALLOY
9. 1–1/2" M CAMLOCK X 1–1/2" M NPT (PART F), ALUM. ALLOY
10. 1–1/2" NPT BALL VALVE, BRASS
11. 1–1/2" NPT CLOSE NIPPLE, GALV.
12. 1–1/2" NPT STREET ELBOW, GALV.
13. 1/2" NPT BALL VALVE, BRASS
14. 1/2" NPT CLOSE NIPPLE, GALV.
15. 1–1/2" M NPT X 1/2" F NPT REDUCER BUSHING, GALV.
16. 1–1/2" F NPT X 1–1/2" F NPT X 1–1/2" F NPT TEE, GALV.
17. 1–1/2" NPT CLOSE NIPPLE, GALV.
18. 1–1/2" F NPT PIPE SADDLE, CARBON STEEL
19. 2" TO 12" ø PIPE HEADER, CARBON STEEL
20. 1/2" HOSE CLAMP
21. 1/2" M NPT TO X 1/2" HOSE BARB
22. 1/2" SWING CHECK VALVE, BRASS
23. 1/2" NPT CLOSE NIPPLE, GALV.
24. 2" to 6" ø STEAM HEADER, CARBON STEEL
25. 1" ø AIR SUPPLY LINE, CARBON STEEL
26. 1" F NPT WELDOLET, CARBON STEEL
27. 1" NPT BALL VALVE, SS
28. 1" HAMMER LOCK ASSEMBLY, ZINC PLATED DUCTILE IRON
29. 1" COLLAR LOCK BOLT CLAMP, PLATED DUCTILE IRON
30. 1" STEAM HOSE

TEMPERATURE MONITORING POINT



TEMPERATURE COMPONENTS

1. TEMPERATURE SENSOR STRING, 3/8" STRING DIA.
2. 3/8" X 3/4" M NPT CORD GRIP, NYLON
3. 1–1/2" M NPT X 3/4" F NPT BUSHING, GALV.
4. 1–1/2" NPT PIPE TEE, GALV.
5. 1–1/2" M NPT X 3/8" F NPT BUSHING, GALV.
6. 3/8" NPT STREET ELBOW, GALV.
7. 3/8" NPT CLOSE NIPPLE, GALV.
8. 3/8" NPT BALL VALVE, BRASS
9. 3/8" M NPT X 1/4" HOSE BARB, BRASS
10. 1–1/2" M NPT CARBON STEEL RISER STICKUP

NOTE: Wellhead details are elevation views.

STEAM INJECTION WELL METERING STATION

1. 2" STEAM PIPE, CARBON STEEL COMPLETE WITH M NPT THREADING
2. U-CLAMP COMPATIBLE WITH 2" ø PIPE
3. 2"F NPT GATE VALVE, BRASS
4. 2"F x 2"F x 2"F TEE, BLACK STEEL (TYP.)
5. 2"M x 1/4"F REDUCER BUSHING, BLACK STEEL (TYP.)
6. 1/4"M x 1/4"M PIGTAIL SYPHON, CARBON STEEL
   - 500 PSI PRESSURE RATING
   - 400°F TEMPERATURE RATING
7. 1/4" FULL PORT BALL VALVE, BRASS
8. 0-30 PSI DRY BOTTOM MOUNT PRESSURE GAUGE
9. 2"M x 1"F REDUCER BUSHING, BLACK STEEL (TYP.)
10. 1" STEAM PIPE, CARBON STEEL COMPLETE WITH M NPT THREADING
11. 1" PRESSURE REGULATOR, 10-30 PSI OUTLET PRESSURE, CAST IRON
12. 1" HIGH PRESSURE STEAM PIPE, CARBON STEEL COMPLETE WITH M NPT THREADING
13. ORIFICE PLATE METERING ASSEMBLY:
    - #150 FF THREADED A105 CORNER TAP FLANGE (1/8" TAP), CS
    - DIFF. PRESSURE GAUGE, 0-5 PSI DP
    - ECCENTRIC ORIFICE PLACE COMPLETE WITH WEEP HOLE (SIZED FOR 150 PSI SYSTEM)
14. U-CLAMP COMPATIBLE WITH 1" ø PIPE
15. 0-200 PSI DRY BOTTOM MOUNT PRESSURE GAUGE
16. 1/4" FULL PORT BALL VALVE, STAINLESS STEEL
17. 1"M x 1/4"F REDUCER BUSHING, BLACK STEEL (TYP.)
18. 50-500°F TEMPERATURE GAUGE
19. 1/2"F x 3/4"M THERMOWELL, STAINLESS STEEL
20. 1"M x 3/4"F REDUCER BUSHING, BLACK STEEL (TYP.)
21. 1"F x 1"F x 1"F TEE, BLACK STEEL (TYP.)
22. 1" FULL PORT BALL VALVE, STAINLESS STEEL
23. 1" HAMMER LOCK ASSEMBLY, ZINC PLATED DUCTILE IRON
24. 1" COLLAR LOCK BOLT CLAMP, PLATED DUCTILE IRON
25. SAFETY LANYARD
26. 1" GREENLINE G572-100 EPDM STEAM HOSE
27. UNISTRUT BRACE

CLIENT: **AECOM**

PROJECT: **Roxana Public Works Yard, Roxana, Illinois**

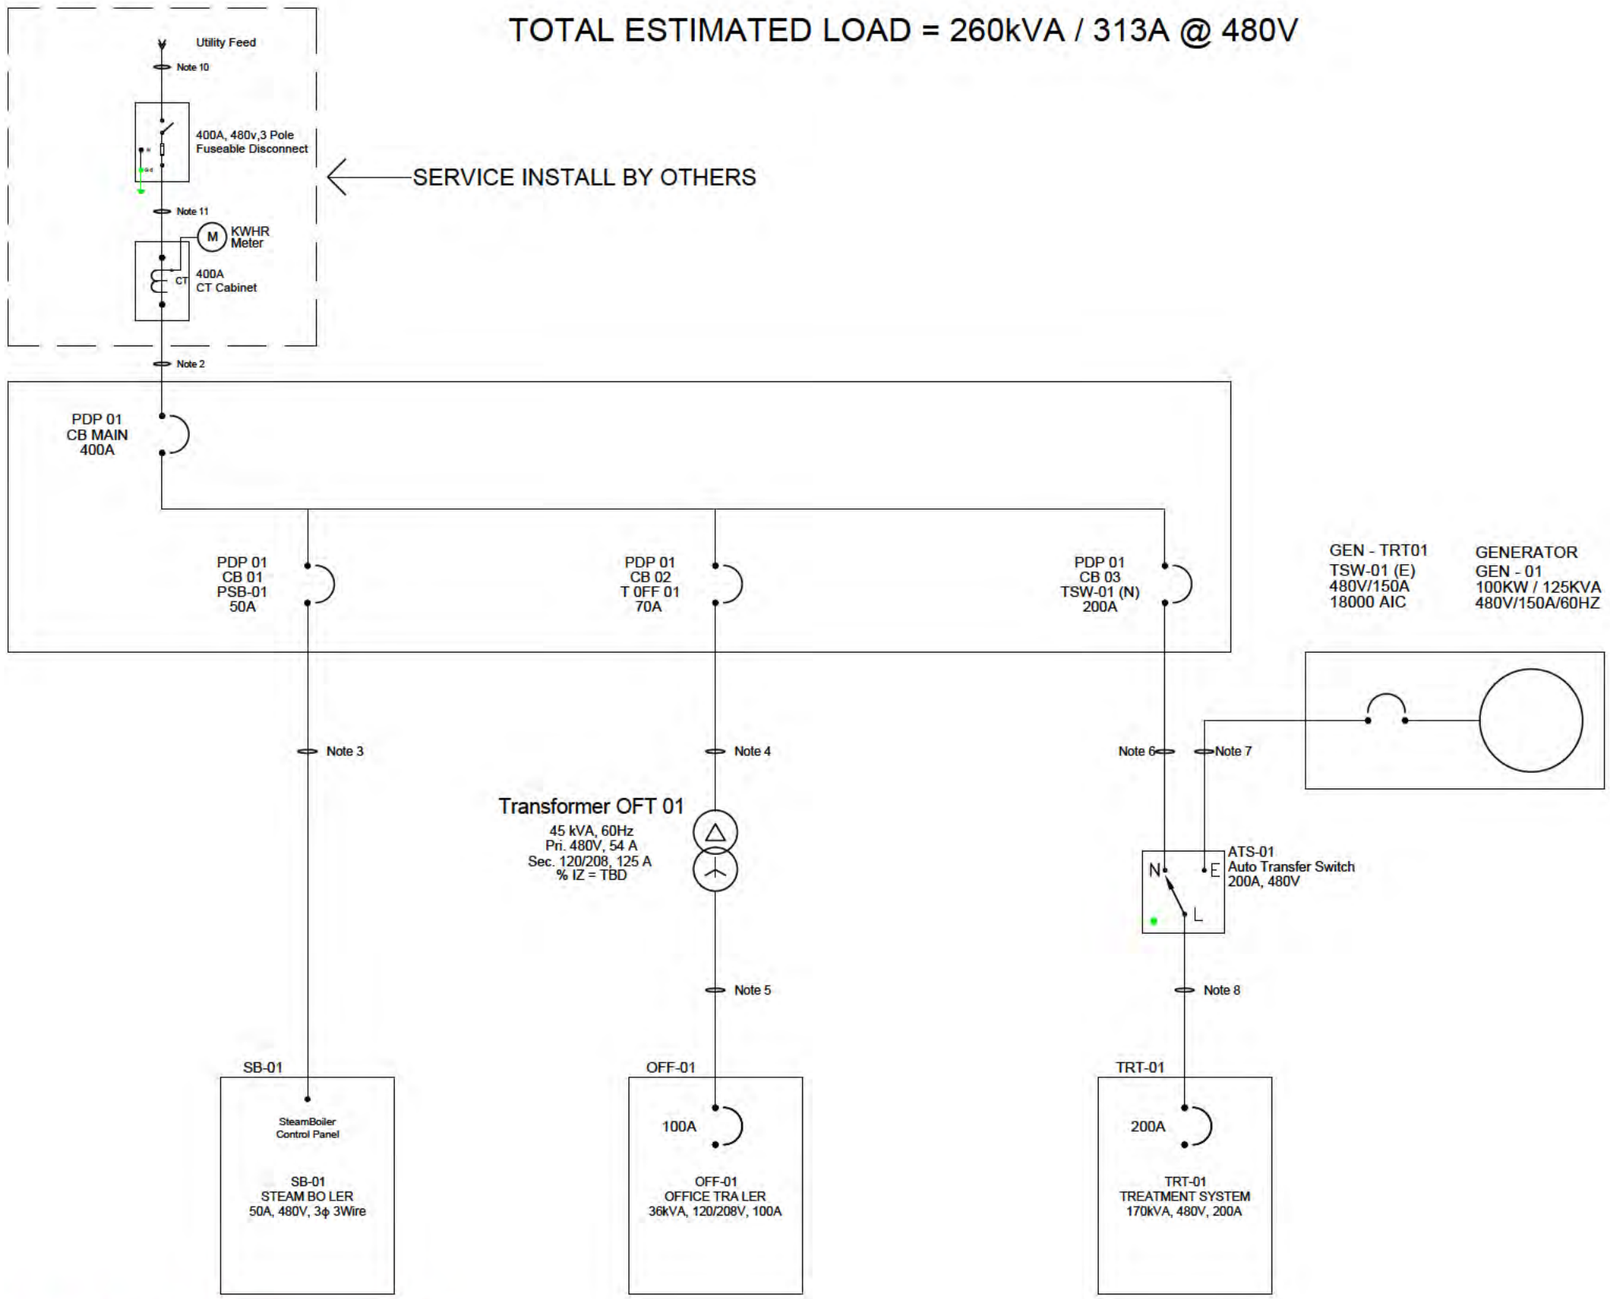
SHEET: **EPD-01**

TOTAL ESTIMATED LOAD = 260kVA / 313A @ 480V



General Notes

1. Construction and material shall comply with applicable Federal, State, local building codes and the National Electrical Code (NEC).

2. Cable from Metering Cabinet to PDP 01 (CB Main): Two (2) 3C-250 kcmil c/w #2 AWG AL Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

3. Cable from PDP 01 (CB 01) to SB-01 Control Panel: One (1) 3C-#4 AWG c/w #6 AWG AL Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

4. Cable from PDP 01 (CB 02) to Transformer OFT 01: One (1) 3C-#4 AWG c/w #6 AWG AL Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

5. Cable from Transformer OFT 01 to Office trailer OFF-01: One (1) 4C-#2/0 AWG c/w #4 AWG AL Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated)*

6. Cable from PDP 01 (CB 03) to Auto Transfer Switch ATS-01 (N) : One (1) 3C-250 kcmil c/w #2 AWG AL Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

7. Cable from GEN-01 to Auto Transfer Switch ATS-01 (E): One (1) 3C-250 kcmil c/w #2 AWG Cu Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

8. Cable from Auto Transfer Switch ATS-01 (L) to Treatment System TRT-01: One (1) 3C-250 kcmil c/w #2 AWG Cu Ground *(STR AL NUAL Alcan Type ACWU90 XLPE INS AIA BLK PVC JKT 600V 90C HL CSA C22.2 NO.51, above ground rated).*

9. All electrical equipment shall be grounded in accordance with NEC.

10. Service conductors from Utility feed connection to 400A fused weaterproof (NEMA 3R) disconnect: Two (2) parallel runs of the following; Four (4) 3/0 AWG Cu conductors in conduit. (MATERIAL AND INSTALLATION BY OTHERS).

11. Service conductors from 400A fused disconnect to Meter cabinet: Two (2) parallel runs of the following; Four (4) 3/0 AWG Cu conductors in conduit. (MATERIAL AND INSTALLATION BY OTHERS).

12. SERVICE EQUIPMENT (DISCONNECT, METERING CABINET, CABLE and CONDUITS) MATERIAL AND INSTALLATION BY OTHERS.

1 Summary

The objective of the simulation study is to develop a subsurface model of the Roxana Public Works Yard in-situ thermal remediation site located in Roxana, Illinois using steam injection in conjunction with a MPE system. The model will be used to determine the basis for the SEE system design and operating strategy, specifically, to address many of the design elements of the SEE system as conceptually shown in Figure 1.5.

The project has two operating areas which were modelled as Area A and B. This summary is for the treatment volume making up the total project. The results of this model estimate the pertinent design characteristics of a SEE remediation project, such as:

1. Total energy input of 8,804 $MW \cdot h$ or 555 kWh/m^3 (425 kWh/yd^3);
2. Total water extraction volume of 25,769,756 L (6,807,649 gallons);
3. Total water injection volume of 14,167,834 L (3,742,746 gallons);
4. Vapor extraction rate of 1,783 scfm (50.40 sm^3/min);
5. Time to reach target temperatures of 43 to 45 days in 90% of the treatment volume;

6. Peak temperatures that are generally limited to the boiling temperature of water as a function of depth and pressure in the soil[1];

7. An anticipated contaminant mass recovery of 10,000 kg (22,046 lbs);

8. Average steam well spacing spacing of 9.14 m (30.00 ft); and,

9. An average extraction well spacing of 12.29 m (40.00 ft)[2].

The site location is shown in Figure 1.1. The project treatment area is shown in Figure 1.2. The total treatment area is approximately 3,863 m^2 (41,582 ft^2) and the total treatment volume is 15,850 m^3 (20,731 yd^3).The total heated area is approximately 4,341 m^2 (46,722 ft^2) and the total heated volume is 17,766 m^3 (23,238 yd^3). The treatment and heated areas for Areas A and B are shown in Figures 1.3 and 1.4. The vertical extent of the treatment volume is shown for Area A and B in Figures 1.6 and 1.7.

The treatment volume extends from an average of 13.57 m BGS (44.50 ft BGS) to an average maximum depth of 17.22 m BGS (56.50 ft BGS). Treatment depth varies based on location. The boundaries of the heated volume extend beyond the extremities of the treatment volume.

[1]Water in the presence of chemicals will boil at the co-boiling temperature of the mixture, which can be less than the boiling point of water.
[2]Extraction well spacing varies over the area of the treatment volume.

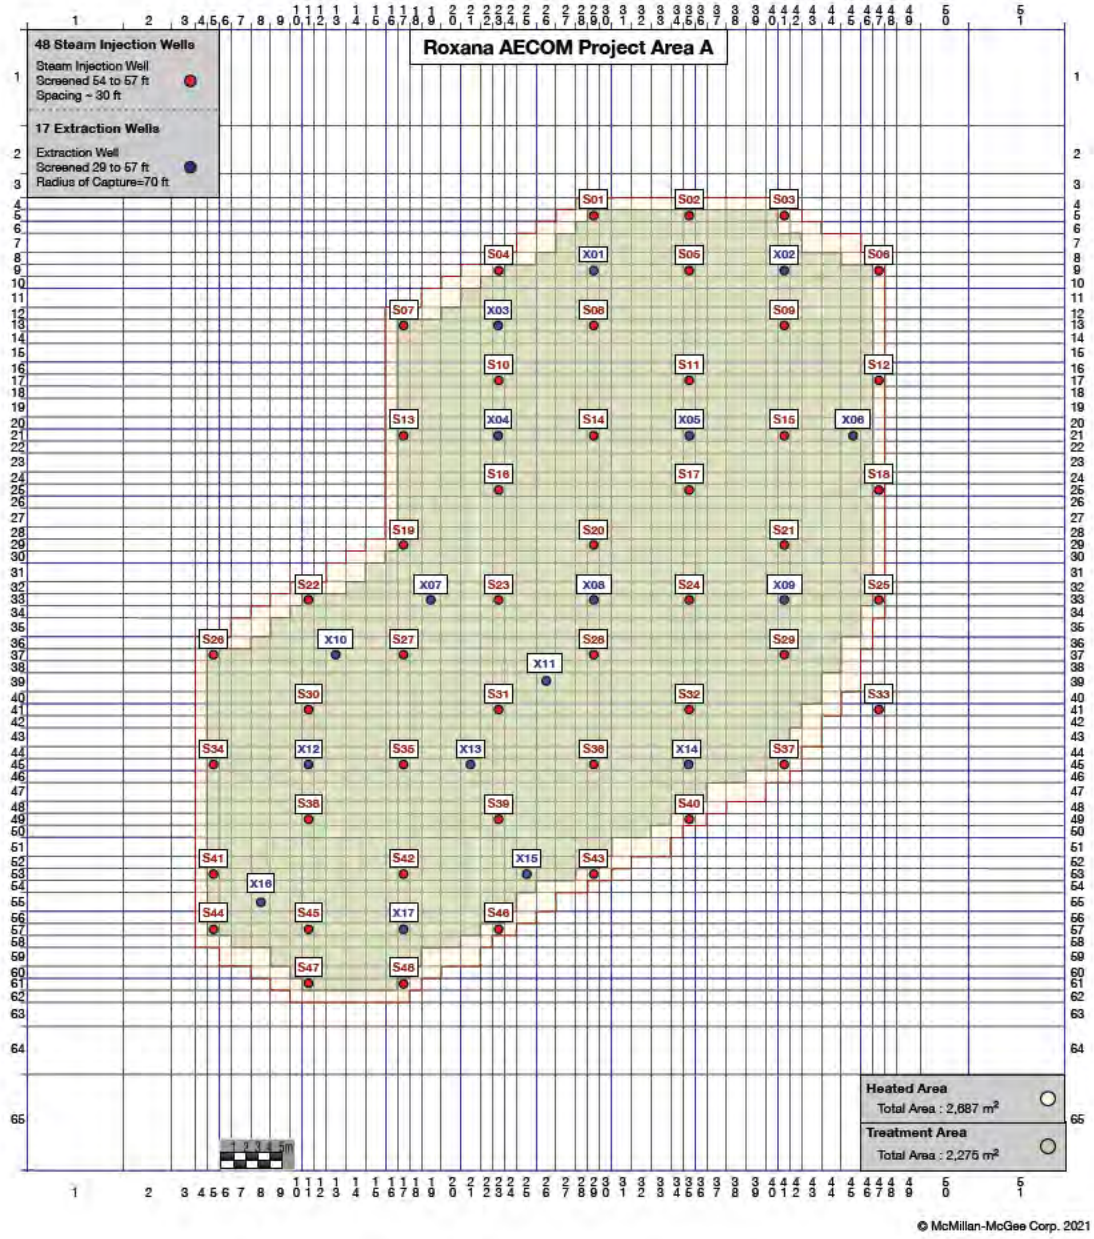

Figure 1.3.: Area A Heated and Treatment Areas

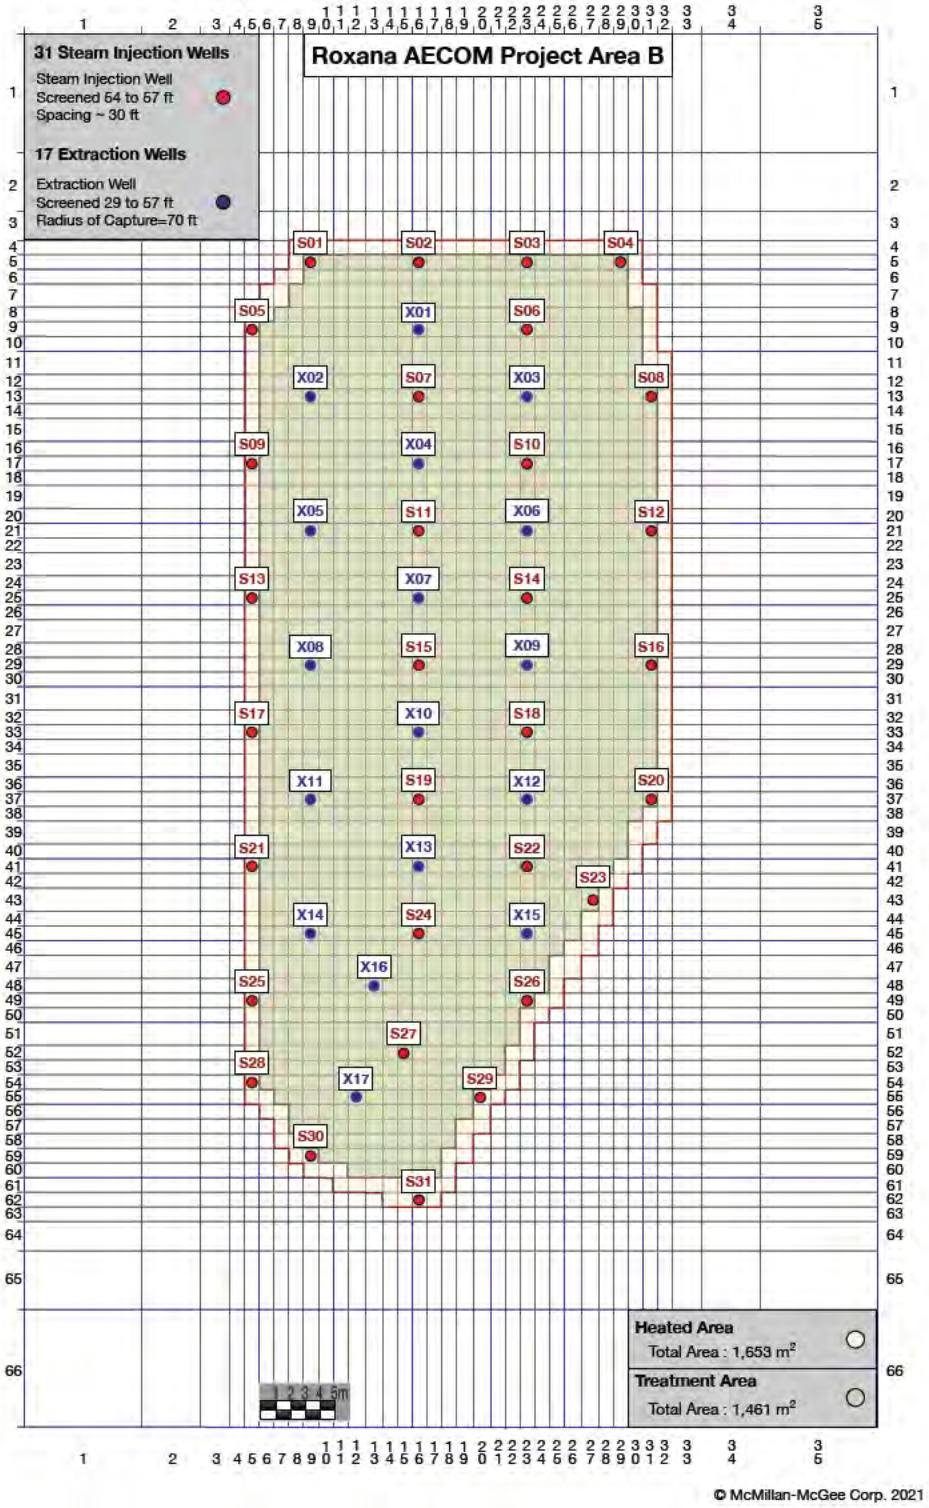

Figure 1.4.: Area B Heated and Treatment Areas

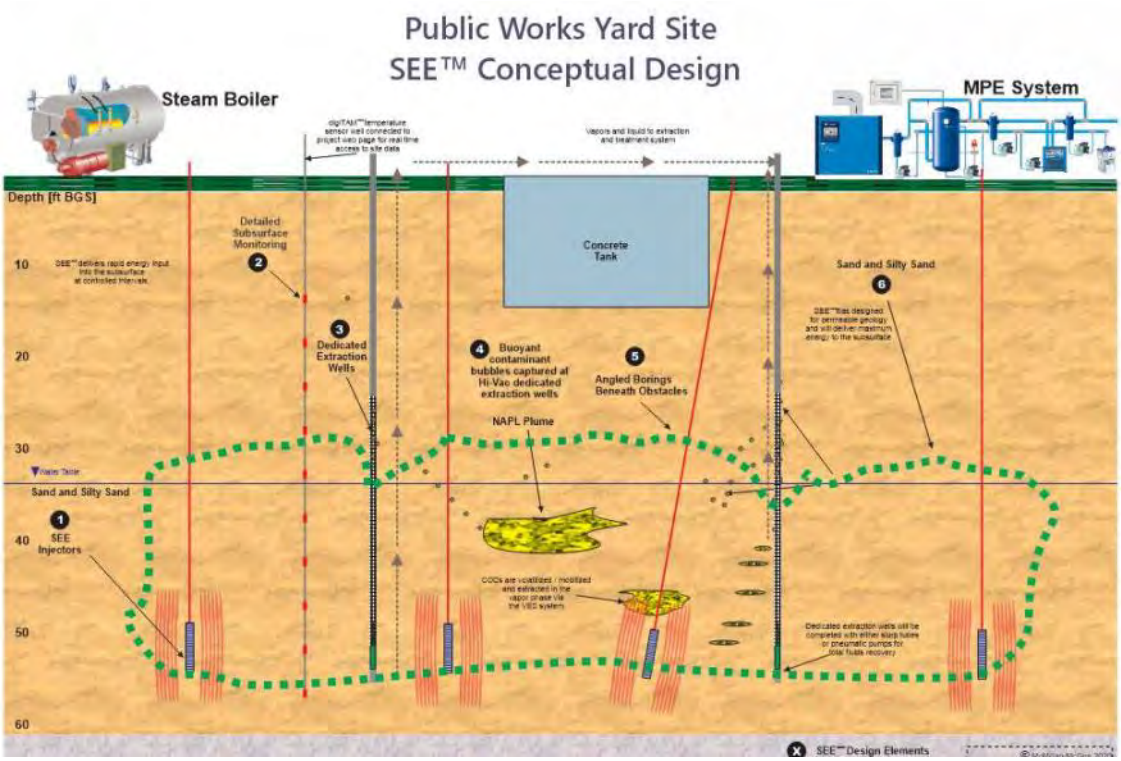

Figure 1.5.: Roxana conceptual model of the remediation process.

The results of the simulation study are provided in chapter 3. The study resulted in a technical approach for this project with specific regard to the following design issues:

Steam Injection Wells (Element 1) Steam injection wells will be used in the permeable sand and silty sand layer to deliver heat to the soil within the treatment interval. The temperature increase will increase the volatility of the contaminants present in the treatment zone allowing them to be recovered at the extraction wells. VOC vapors are created at elevated temperatures in the treatment volume. Steam injection will also sweep contamination towards MPE wells used for vapor capture.

Data Monitoring (Element 2) Continuous remote data monitoring of temperature using digiTAM™ sensors will allow operators to respond in real time to transient subsurface conditions. The data will be available on a dedicated project web page.

Multiphase Extraction (Element 3) Dedicated MPE wells are used to capture fluids for aboveground treatment and discharge. Compressed air pneumatic groundwater recovery pumps are operated at sufficient extraction rates to maintain inward gradients for hydraulic control, as steam is injected to the steam injection wells and this steam displaces groundwater, and they also function as a mechanism to capture dissolved VOCs. Continuous operation of the extraction wells at sufficient vacuums will capture vaporized VOCs, soil gas, and steam for pneumatic control.

Contaminant Mass Removal (Element 4) Buoyancy causes the thermodynamically created contaminant bubbles to rise vertically and escape from the heated volume. Continuous operation of the extraction system with appropriate placement of extraction wells will be sufficient to overcome the vertical buoyancy and pull the bubbles into the extraction wells. Sufficient local and macroscopic connection of vapor pockets causes bubble and/or channel flow upwards towards the vadose zone and towards extraction wells for capture.

Angled Wells (Element 5) Angle steam injection wells, temperature sensor wells, and MPE wells will be used to target contamination beneath site obstacles ensuring site wide remediation.

Formation Properties (Element 6) The hydraulic conductivity corresponding to the sand and silty sand geology of the Site is excellent for steam injection. The average horizontal hydraulic conductivity of 1.24 x 10-2 cm/s is within the recommendations of the EPA.

Water Table Depth to groundwater averaged at 8.0 m below ground surface (average). No perched groundwater table has been observed. For soil above the water table. It is assumed that the ground water flow velocity is negligible within the treatment volume.

Simulation Study The optimization of the heating strategy and operations through detailed data monitoring is intended to minimize the overall energy consumption of the project while still achieving the clean up goals. The simulation study provides a conservative (aggressive heating) estimate of the energy use.

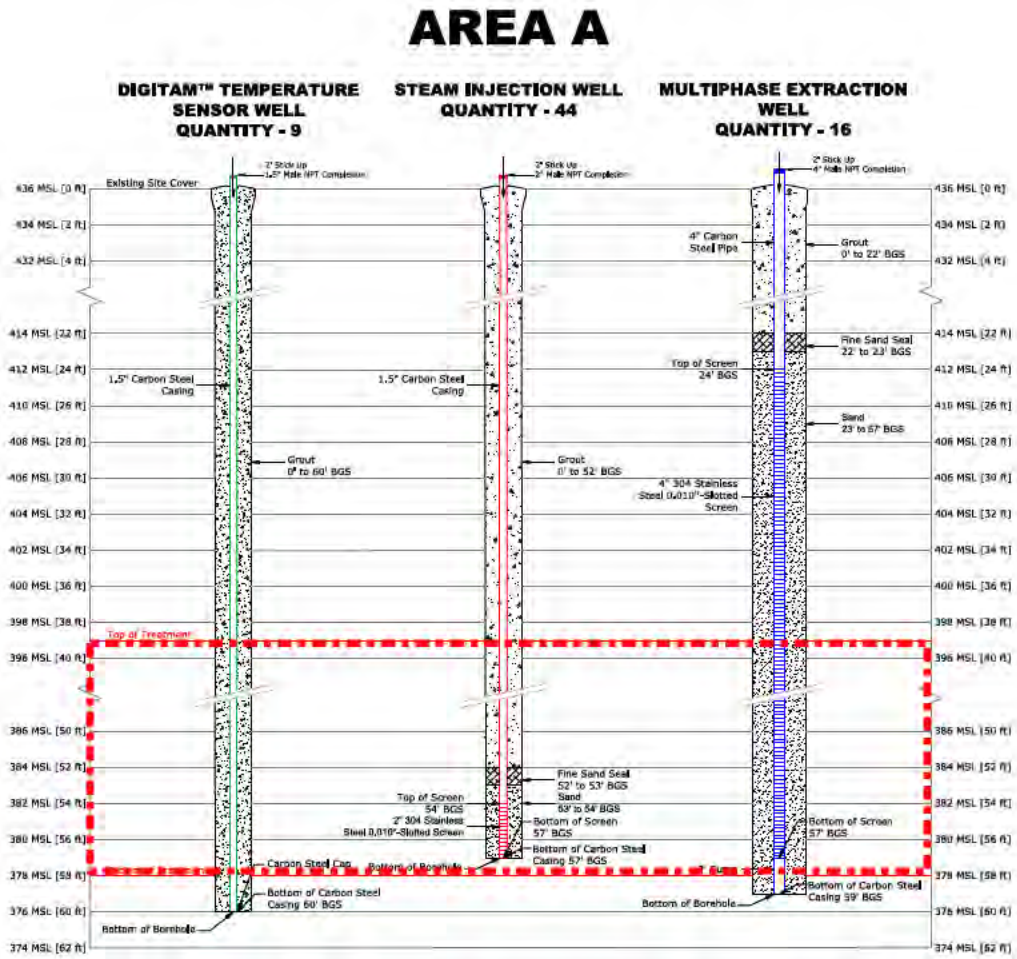

Figure 1.6.: Vertical extent of the steam wells.

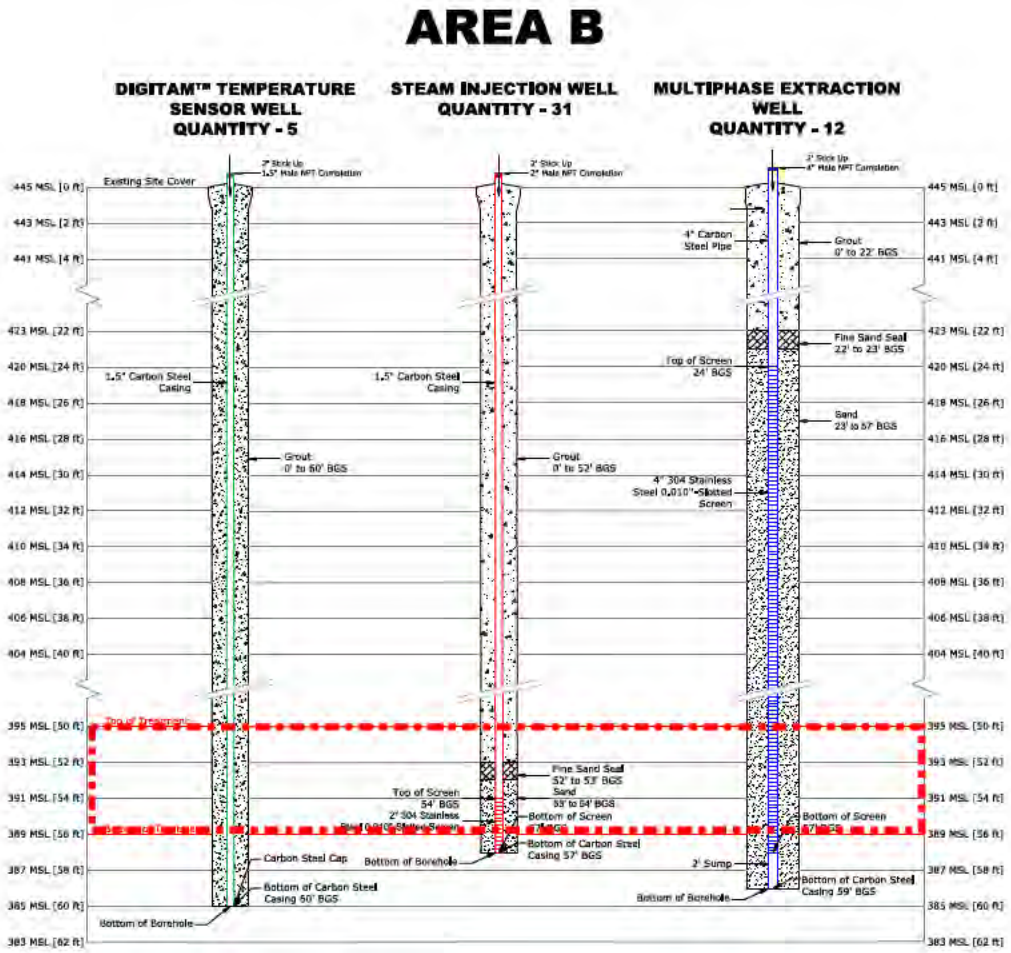

Figure 1.7.: Vertical extent of the steam wells.

2 Simulation Study

The input data for this numerical model were obtained from AECOM and site-specific analyses. Data not available from AECOM were obtained from the public domain. An aggressive heating approach was taken in the preparation of the data file.

Figure 2.1 shows the site plan for Roxana. The scope of this simulation study is limited to only the SEE process within the treatment volume specified by AECOM.

2.1. The Site

2.1.1. Background Information

The PWY is located in a mixed use area surrounded by industrial users, primarily petroleum refining and storage facilities. The Site is bounded by Old Edwardsville Road to the west, East Eighth Street to the north, a rail corridor to the south, the Phillips 66 Wood River Refinery directly to the east (See Figure 2.1). The nearest residential properties are located on the north side of East Eighth Street approximately 80 feet from TTZ Area A. The property has an areal extent of approximately 2.4 acres, approximately 0.4 acres of which is covered or obstructed buildings or structures [AEC19].

Figure 2.1.: Areal view of Roxana.

A summary of the site conditions are:

1. The primary contaminant of concern (COC) at the site is benzene. However, a total of 142 volatile and semi volatile organic compounds (VOC and SVOC) were analyzed for in both the soil and groundwater at the Site and a number of other VOCs and SVOCs were identified to be present. Benzene was the mostly commonly encountered contaminant while 1-methylnapthalene was the second most commonly encountered contaminant in both soil and groundwater [AEC19].

2. The treatment interval varies throughout the treatment area but ranges from 11.9 meters at its most shallow to 17.22 m BGS at its deepest as reported by AECOM.

3. Based on information supplied by AECOM, the treatment volume is entirely comprised of medium to course grained sand with relatively thin silty zones.

4. It is expected that any pre-existing wells not suitably constructed for exposure to high temperature will be decommissioned prior to the implementation of thermal treatment.

5. Volatile chemical removal from the subsurface within the timeframe of 180 days is the desired outcome of remediation effort. This is anticipated to reduce the risk posed to human health and the environment by site contaminants.

6. A network of multiphase (vapour and groundwater) wells will be installed and operated within the treatment area to ensure that hydraulic and pneumatic control are maintained throughout operations.

2.1.2. Geology

The geology of the Site, within the TTZ, generally consists of medium to course grained sand with interbedded silty zones that are relatively thin and discontinuous [AEC20].

The site's geological layers are understood from the details of the AECOM model as shown in Table 2.1 and Figure 2.2 and 2.3.

Geology		
Thickness (ft)	Type	Description
0 to 5	Fill	Clay, gravel, cinders. Discontinuous across the site.
3 to 15	Silty Clay	Silty clay. Area B is generally thinner (5 ft); Area A is generally thicker (up to 15 ft).
approx. 45	Medium Sand	Primarily medium grained sand down to approximately 60 ft below ground surface (ft BGS).
>30	Medium/Course Sand	Transition to medium/course grained sand to depths of 93 ft BGS.

Table 2.1.: Input Geology

Groundwater within the TTZ ranges between 28 and 37 ft BGS, depending on where it is measured on site and of course precipitation and flow conditions in the Mississippi River. Groundwater flow direction, which was once toward the Mississippi (toward the west), is now toward the industrial pumping wells operated by Wood River Refinery east of the Site.

With regards to thermal treatment, the geology (and hydrogeology) is excellent for steam injection. The EPA recommends hydraulic conductivities greater than 10-4 centimeters per second (cm/s) for steam injection [EPA15]. The average horizontal hydraulic conductivity of the formation within the TTZ is 1.24 x 10-2 cm/s. Even with the high permeability and relatively high pumping rate from the Wood River Refinery (minimum 3000 gallons per minute [AEC19]), the groundwater velocities reported in the RFP are relatively low at 0.1 to 0.3 feet per day (ft/day). This means that the energy losses associated with groundwater influx are anticipated to be relatively low.

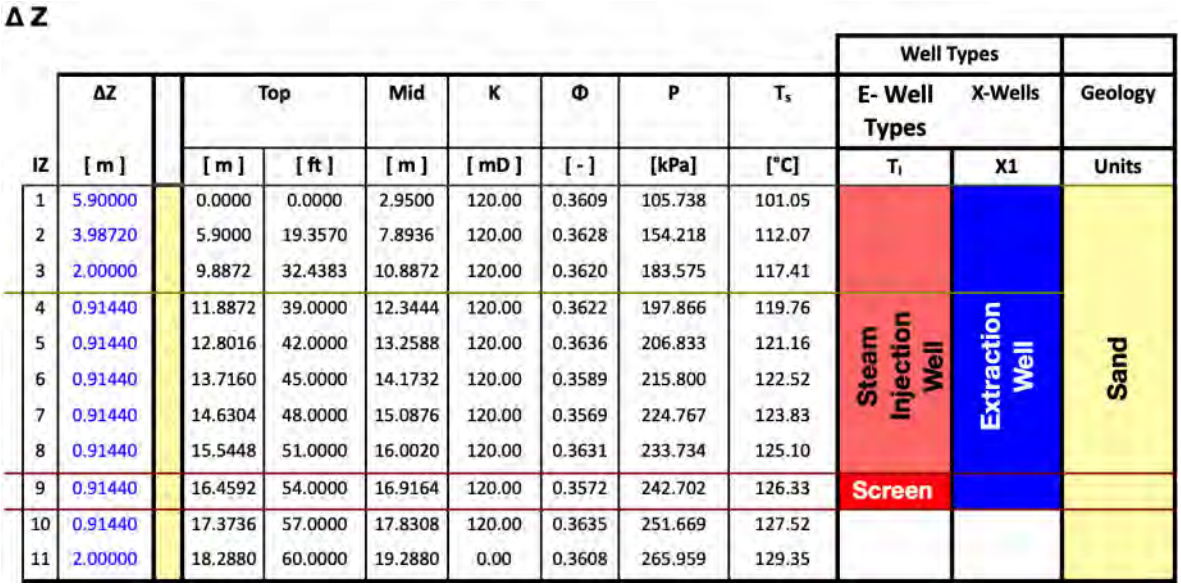

Figure 2.2.: Area A Geological properties assumed in the treatment volume.

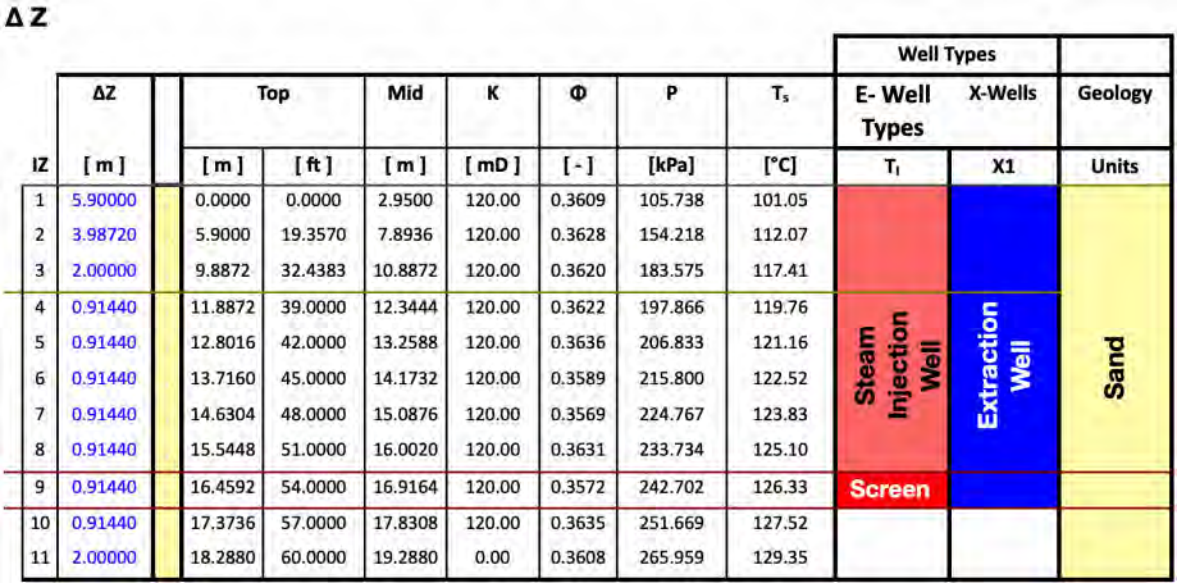

Figure 2.3.: Area B Geological properties assumed in the treatment volume.

2.2. Assumptions

2.2.1. General Assumptions

Some of the more general project assumptions captured in the simulation are:

1. The input energy estimates are for steam operations only. Additional energy for the project is required to run the treatment plant and/or for contingency operations.
2. The heated volume generally surrounds the treatment volume in all dimensions in order to ensure complete thermal treatment of the contaminants.
3. Water for the steam boiler is from the municipal supply.
4. Each multiphase extraction well is assumed to extract liquids and vapors at the same rates as all the other extraction wells within the area with the exception of the corridor extraction wells. For effective and economic remediation, the extraction wells should be operated with this strategy. It is very important to maintain hydraulic control and not over extract liquids relative to cold water equivalent injection into the steam injection wells.
5. The chemical mass is *uniformly* distributed throughout the treatment volume.
6. To achieve the minimum temperature target early in the project, an aggressive ramp-up with increased steam injection to each steam injection well is necessary.
7. The water saturation distribution, S_w, is assumed to be 100%. The chemical saturation is comparatively small.

2.2.2. Specific Assumptions

1. It is assumed that steam to the steam injection wells dominates the energy input to the soil. Actual steam injection rates will be controlled during the project to maintain the recommended power levels.
2. Based on information provided by AECOM, it is assumed that the groundwater velocity is less than 0.3 m per day, and will have a negligible affect on heating. Groundwater, having a large heat capacity, is a key element in uniform heat transfer, and high groundwater flow velocities can result in energy penalties within the heated volume. Typically, local groundwater flow velocities greater than 0.3 m per day become problematic for attaining the target temperatures.

2.2.3. Hydraulic Conductivity

Hydraulic conductivity, (K) is a property of the soil or rock that is a measure of the ease with which a fluid (water in this case) can move through the pore space. It depends on the intrinsic permeability of the material, the viscosity of the fluid, the density of the fluid, and in cases of multiphase flow, the degree of fluid saturation. For this study, values of saturated hydraulic conductivity, which describes water movement through saturated media, were assumed from literature. To convert units of hydraulic conductivity in cm/s to Darcy units, refer to Appendix D.

Typical values for the hydraulic conductivity (in cm/s) for different soil types are summarized in Table 2.2[FC79]. The permeability can vary over several orders of magnitude for a particular soil type. Darcy's law is used to convert the units of hydraulic conductivity to permeability units for input into the numerical simulation program (see details in Appendix D). For water, to convert from 1 cm/s to Darcys multiply by 1,034. For example, from Table 2.2 clean sand has a hydraulic conductivity to water of 10^{-4} cm/s, which is equivalent to 0.1034 D or 103.4 mD (input units for the numerical model). The resulting permeability estimates used in this study are in the range of typical values as shown in Table 2.2.

Hydraulic Conductivity	
Material	K [cm/s]
Gravel	10^{-1} to 10^{2}
Clean sand	10^{-4} to 10^{0}
Silty sand	10^{-5} to 10^{-1}
Silt	10^{-7} to 10^{-3}
Glacial till	10^{-10} to 10^{-4}
Clay	10^{-10} to 10^{-6}
Limestone	10^{-7} to 10^{0}
Fractured basalt	10^{-5} to 10^{0}
Sandstone	10^{-8} to 10^{-3}
Igneous rock	10^{-11} to 10^{-2}
Shale	10^{-14} to 10^{-8}

Table 2.2.: Typical Values of Hydraulic Conductivity.

When very large or small permeabilities are input into the numerical model, simulation calculations can become problematic to compute. In order to improve the efficiency

and stability of the numerical model and to provide conservative engineering design, the higher range of permeabilities from typical values are used. Figure 2.4 shows how the permeability can be affected (increased) by transformation of the lithology as a result of heating and creating steam within the porosity of the clay.

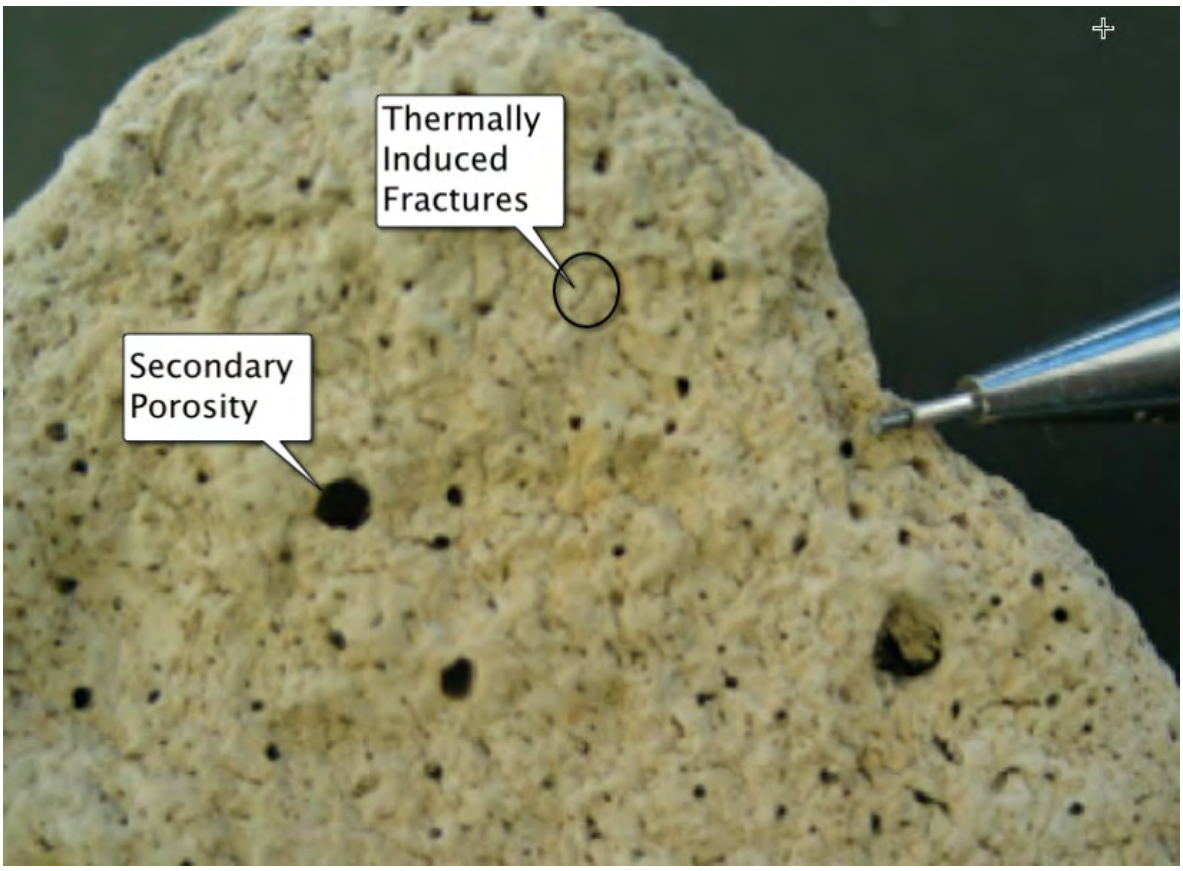

Figure 2.4.: Clay After in-situ heating

The horizontal hydraulic conductivities (k_x and k_y) in the model were estimated to be 333.33 mD as summarized in Table 2.3. The vertical hydraulic conductivities (k_z) were estimated as one fifth of the horizontal values.

Permeabilty [mD]				
Layer	Depth [m]	k_x	k_y	k_z
1	2.95	333	333	67
2	7.89	333	333	67
3	10.89	333	333	67
4	12.34	333	333	67
5	13.26	333	333	67
6	14.17	333	333	67
7	15.09	333	333	67

11	19.29	333	333	67
	Average	333	333	67
	Maximum	333	333	67
	Minimum	333	333	67

Table 2.3.: Input permeability, k_x, k_y, and k_z data.

2.2.4. Thermal Properties

Component Properties

The properties for the chemicals, water, soil (rock), and gas phases are obtained from the public domain. The *base* physical and thermal property data are summarized in Table 2.4. The density of the liquids and solids change as a function of pressure and temperature, which are accounted for in the model.

Physical Properties

Saturation Input Data		
Chemical	S_c	$S_c < 0.000448$, $\hat{S}_c = 0.00$
Water	S_w	$\hat{S}_w = 1.00$
Compressibility Input Data [kPa^{-1}]		
Chemical	cp_c	$4.63 \cdot 10^{-7}$
Water	cp_w	$4.64 \cdot 10^{-7}$
Rock	cp_r	$1.15 \cdot 10^{-6}$
Coefficient of Thermal Expansion [$°C^{-1}$]		
Chemical	ct_c	$7.85 \cdot 10^{-4}$
Water	ct_w	$2.66 \cdot 10^{-4}$
Rock	ct_r	$5.00 \cdot 10^{-4}$
Specific Heat Input Data [$kJ/(kg\ °C)$]		
Chemical	C_c	0.837
Water	C_w	4.180
Rock	C_r	2.430
Thermal Conductivity Input Data [$W/(m\ °C)$]		
Chemical	λ_c	0.21

+1	2.00	153.00	4.50	20.00

Thermal Conductivity

Temperature, saturation, and dry density are parameters that determine the thermal conductivity of soils. An increase in any of these parameters will result in an increase in thermal conductivity of the soil, with temperature having the least influence of the three [Ker49] and saturation having the most significant impact.

Table 2.6 summarizes the typical values of thermal conductivity.

Table 2.6.: Typical thermal conductivity values.

Component	Symbol	Thermal Conductivity $\frac{W}{m°C}$
Oil	λ_o	.13889
Water	λ_w	.67083
Rock	λ_r	7.40000
Steel Pipe	λ_q	50.00000
Fluid	λ_f	.27188
Reservoir	λ_r	2.04100

Several correlations for the thermal conductivity of soils are available in the literature. The correlations are generally developed for five soil types; gravels, sands, silts, clays, and peats. These soil types correspond to those used in the Unified Soil Classification System (USCS)[Cas47].

A unified approach has been developed by Fricke et. al. [FMSB00] for estimating the thermal conductivity for different soil types at different water saturations. The water saturation implicitly accounts for the density of the soil as indicated in Equation 2.1. The Fricke approach is used here to supplement the thermal conductivities measured in the laboratory.

$$S_w = \frac{\rho_d \, w}{\rho_w \left[1 - \frac{\rho_d}{\rho_S}\right]} \tag{2.1}$$

The dry density is $\rho_d = \frac{M_S}{V_T}$ and the solid density is $\rho_S = \frac{M_S}{V_S}$, where M_S is the mass of solid soil particles, V_S is the volume of the solid particles (no porosity), and V_T is the total volume (with porosity).

The model developed by Fricke et. al. to describe the behaviour of changing thermal conductivity as a function of moisture content is as follows:

$$S_w = \beta_1 \left[\sinh\left(\beta_2 \, \lambda + \beta_3\right) - \sinh\left(\beta_4\right)\right] \tag{2.2}$$

The high correlation coefficients below are selected for the Fricke calculation to determine thermal conductivity inputs to the model. The high range parameters are used based on the work of Farouki [Far81] shown in Figure 9 of the reference. The thermal conductivities measured in the laboratory for the silt material correspond with the calculations using mid-range correlation coefficients.

Table 2.7.: Fricke high-value correlation coefficients.

Soil Type	β_1	β_2	β_3	β_4
Clay	14.0	0.32	-3.0	-1.72
Gravel	8.3	0.20	-1.8	-0.80
Peat	28.0	0.86	-1.9	-1.47
Sand	6.8	0.50	-3.5	-2.00
Silt	22.0	0.25	-2.2	-0.95

The Fricke calculations for estimating thermal conductivity of the treatment volume are summarized in Figure 2.5.

Fricke Thermal Conductivity Correlation Parameters for Sand

Result

$$S_w = \beta_1 \left[\sinh\left(\beta_2 \lambda + \beta_3\right) - \sinh\left(\beta_4\right)\right]$$

Figure 2.5.: Fricke et. al. correlation is used to determine the thermal conductivity of the soils in the treatment volume.

The input data for thermal conductivity are summarized in Figure 2.6. Saturation is a measure of the moisture contained within the pore space of the soil and dry density is the mass per unit volume with the pore space void of moisture.

2.2.5. Well Layout and Grid

The well layout and grid are designed so that steam and extraction wells are located to ensure complete vertical and areal heating of the treatment volumes in accordance with the remediation objectives. This is considered a large simulation study so the treatment area was split into 2 Sub-grids: Area A and Area B.

For Area A, there are 51 grid blocks in the x direction, 65 grid blocks in the y direction, and 11 grid blocks in the z direction, for a total of 36,465 grid blocks.

For Area B, there are 35 grid blocks in the x direction, 66 grid blocks in the y direction, and 11 grid blocks in the z direction, for a total of 25,410 grid blocks.

Figures 2.2 and 2.3 shows the vertical grid profile used in the simulation study along with values for porosity, permeability, and estimated steam saturation temperature based on the hydro-static subsurface pressure below the water table. The depth to the bottom layer of the treatment volume is assumed to vary over the site. Therefore a more complex, non-uniform grid in the vertical direction is used and the base of the steam injection wells extend to the contour of the bottom layer.

Figure 2.7 shows the locations of the 48 steam injection wells for Area A contained within the heated area.

Figure 2.8 shows the locations of the 31 steam injection wells for Area B contained within the heated area.

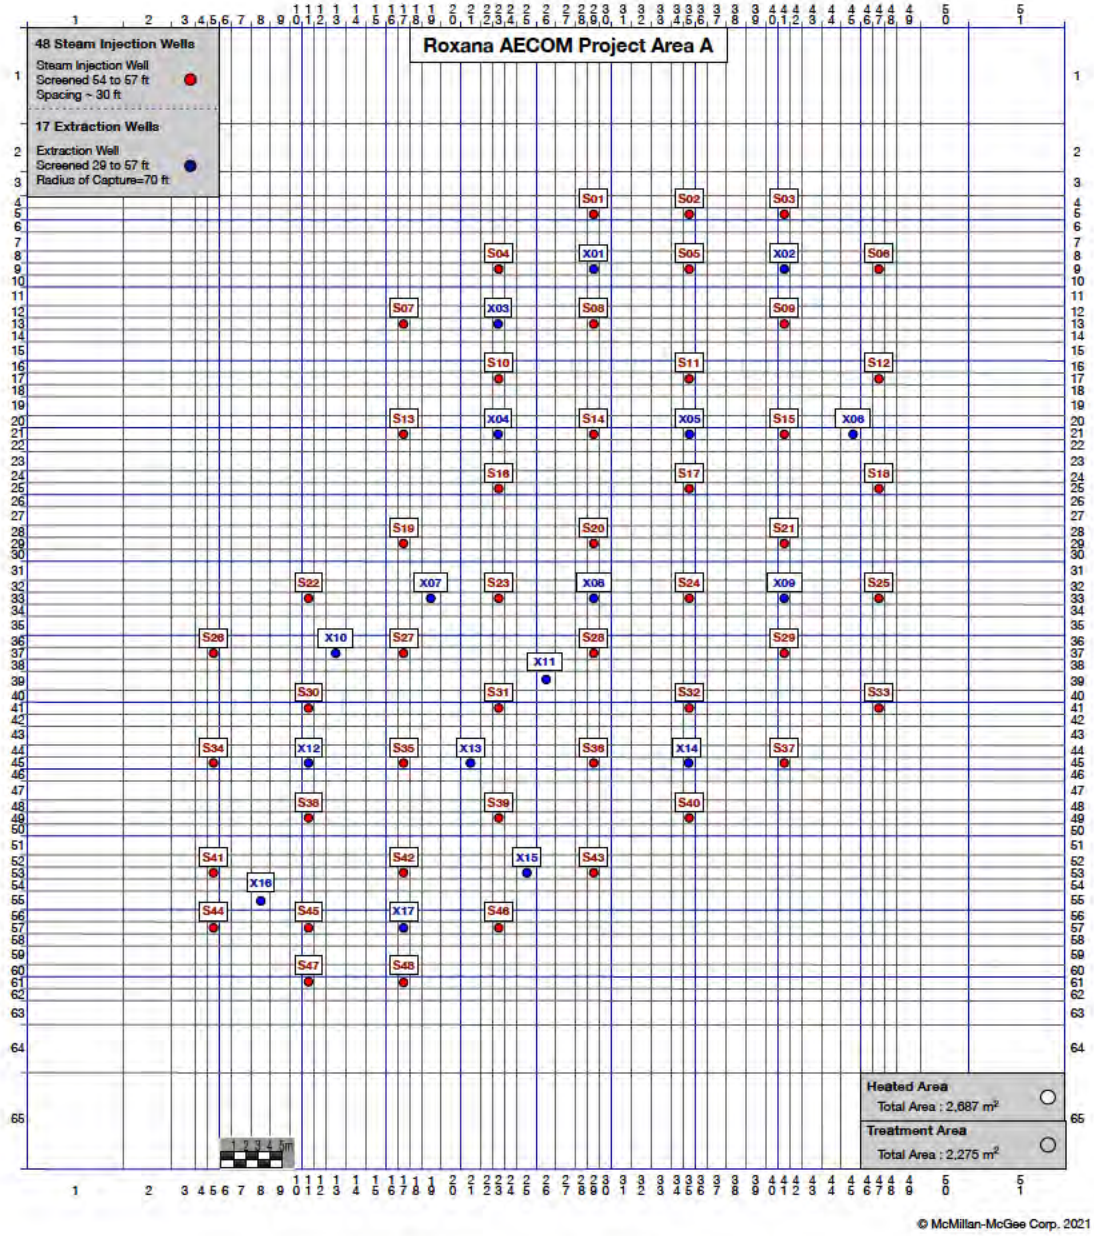

Figure 2.7.: Wellfield layout for Area A.

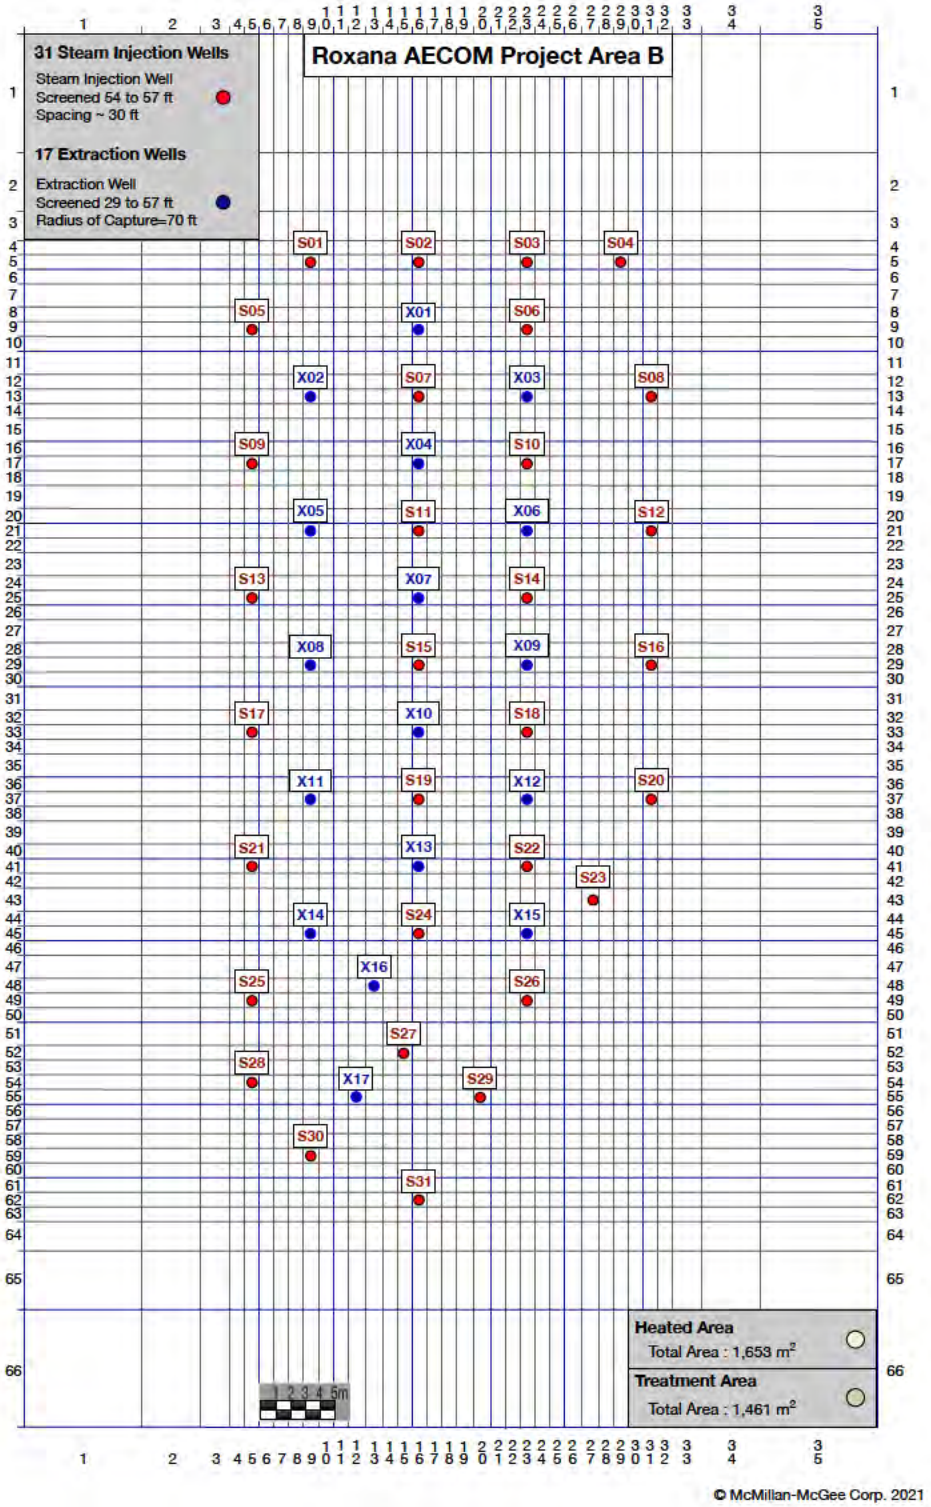

Figure 2.8.: Wellfield layout for Area B.

3 Results

This section presents the results of the study (Roxana Simulation Study) for the site shown in Figure 1.3[1].

Target temperatures[2] throughout the treatment volume can be reached in approximately 43 to 45 days of thermal operations (assuming 100% operational uptime). Although target temperatures will be achieved in this time frame, the simulation study along with previous experience indicates that approximately 180 days of operations is needed to achieve the cleanup goals.

Table 3.1 is a summary for the total project. It is noted that:

1. The length and vertical placement of each steam and extraction well is shown in Tables C.1 and C.2 in Appendix C.

2. The treatment volume is determined using the AECOM site assessment data. These data were discretized over the simulation grid and summed up to estimate the heated and treatment volumes.

3. A high energy injection strategy reaches target temperatures uniformly throughout the heated volume in the shortest period of time. This is achieved using closely spaced steam wells with sufficient energy injection. Aggressive and focused heating

[1] Naming of the steam and extraction wells shown in the figure may change. The naming convention used in this report is for convenience.

[2] The duration is determined by the average temperature at the extraction wells, which are typically the last location to reach target temperatures.

of the lower interval of the wellbore is assumed to ensure rapid development of a *hot floor* at the bottom of the treatment volume. Sufficient energy injection of the also compensates for the possibility of cooling effects from below the treatment volume.

4. The ancillary energy is an estimate of the energy used to run the treatment system and other surface facilities. It is based on the design of the treatment plant and experience with other projects this size.

5. Maximum temperatures in the soil will reach the boiling temperature of water at depth. In the 3D graphical presentation of the temperature data, the maximum has been limited to about 99 °C to visually identify regions that reach target temperature from those regions that do not.

6. The maximum limit of the applied vacuum is based on the design of the treatment plant. The operating vacuum will need to overcome piping pressure drops, varying vadose zone intervals and soil properties at the extraction wells, and thermodynamic effects. These parameters are not accounted for in this study.

7. When average values are presented in tables they are weighted averages unless specified. Any weighted averages are performed on a volumetric basis.

Table 3.2 provides summaries of the technical approach for the total project.

The water balance calculations for the total project are provided in Figures A.5, A.6, A.7, and A.8.

The power and energy balance calculations for the project are provided in Figures A.11 and A.12, respectively.

Figures 3.7 and 3.8. show plots of the average power to the steam injection wells for Area A and B. Figures 3.9 and 3.10 show plots of the average temperature ramp up for Area A and B.

3.1. Results Summary

Installation and operational parameters for individual subsurface components determined for the treatment area from the model are adapted for the contaminants of concern and assume equitable distribution. The total estimated mass in place is 10,000 kg, (22,046 lbs) and is assumed to be uniformly distributed in the treatment volume (a conservative approach) of 15,850 m^3 (20,731 yd^3). The chemical concentration on a volumetric basis is 1,125 g/m^3.

The study focuses on performance goals some of which may include the following:

1. Maintaining system uptime of 95% or more;

2. Attaining a final temperature goal of achieving the boiling point of water in a predetermined percentage of the temperature sensors in the treated volume; and,

3. Reaching VOC concentration shutdown criteria in the treatment system influent, and verifying that soil and groundwater sample data indicate performance criteria have been met in accordance with the afore-mentioned goals.

The study resulted in the following technical approach for the remediation of the treatment volume at Roxana:

1. The project consists of a two operational areas. The total treatment area is 3,863 m^2 (41,582 ft^2) in size with an estimated treatment volume of 15,850 m^3 (20,731 yd^3).

2. The estimated energy delivered to the steam wells is 8,804 $MW \cdot h$ resulting in an energy density of 555 kWh/m^3 (425 kWh/yd^3).[3] The energy accounts for heat losses and energy produced with the water. The ancillary energy used for the treatment plant and other electrical facilities is estimated from experience at 841 $MW \cdot h$. In comparison, the ancillary energy is 9.55 % of the total estimated energy used in the project. Energy balance calculations are provided in Figure A.12.

[3]Thermal efficiencies are gained by re-injection of heated water produced from the extraction wells.

3. The time to reach target temperature is between 43 and 45 days. This is based on reaching the target temperature at the extraction wells[4].

4. 79 steam wells of a fixed length configuration and depth required to provide thermal remediation of the the impacted area. The prototypical steam wellbore configuration is shown in Figures 3.11 and 3.12.

[4]The extraction wells are typically located farthest from the steam wells and therefore these are the last locations to reach target temperature.

Figure 3.12.: Steam wellbore configuration for Area B.

Tables C.1 and C.2 provided in Appendix C gives the x and y co-ordinates for each wellbore relative to the first steam well in the specific area, which has as its co-ordinates, $x = 0$, $y = 0$. Positive $+x$ indicates a displacement relative West (assumes relative North is up), $+y$ indicates a displacement to the South ($-x$ to

the East and $-y$ to the North).

This configuration of steam wells will provide the heat transfer to heat the soil to a target temperature of approximately 99 °C. The peak temperature will vary depending on depth and will be based on the azeotrope of remaining VOC's as well as the boiling temperature of water in the subsurface.

Figures 3.13 and 3.14 show the steam well locations for Areas A and B respectively.

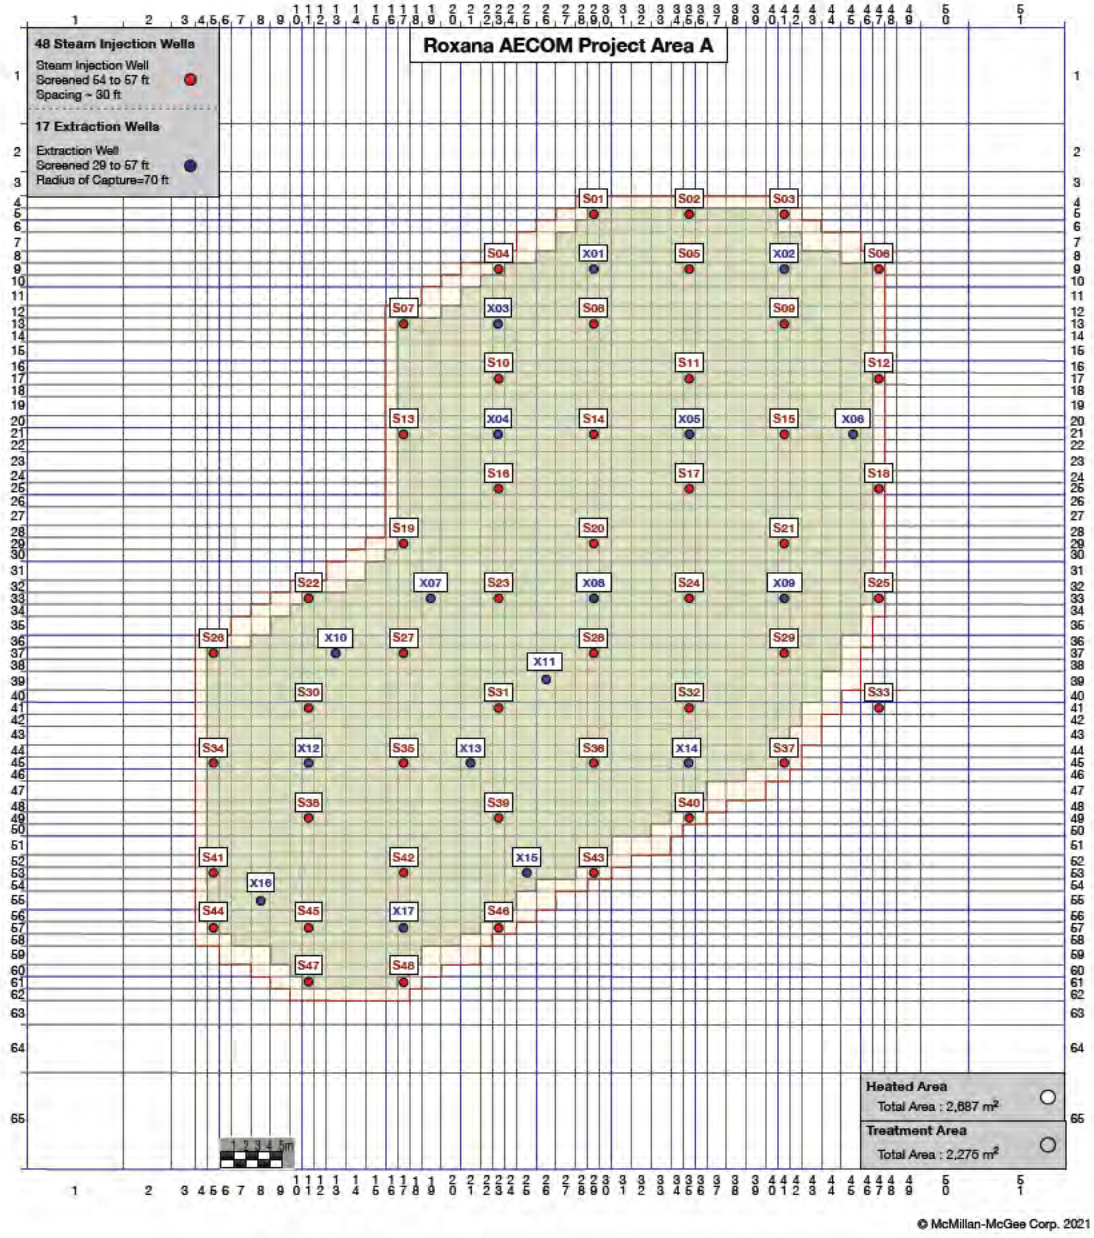

Figure 3.13.: Steam well locations in Area A

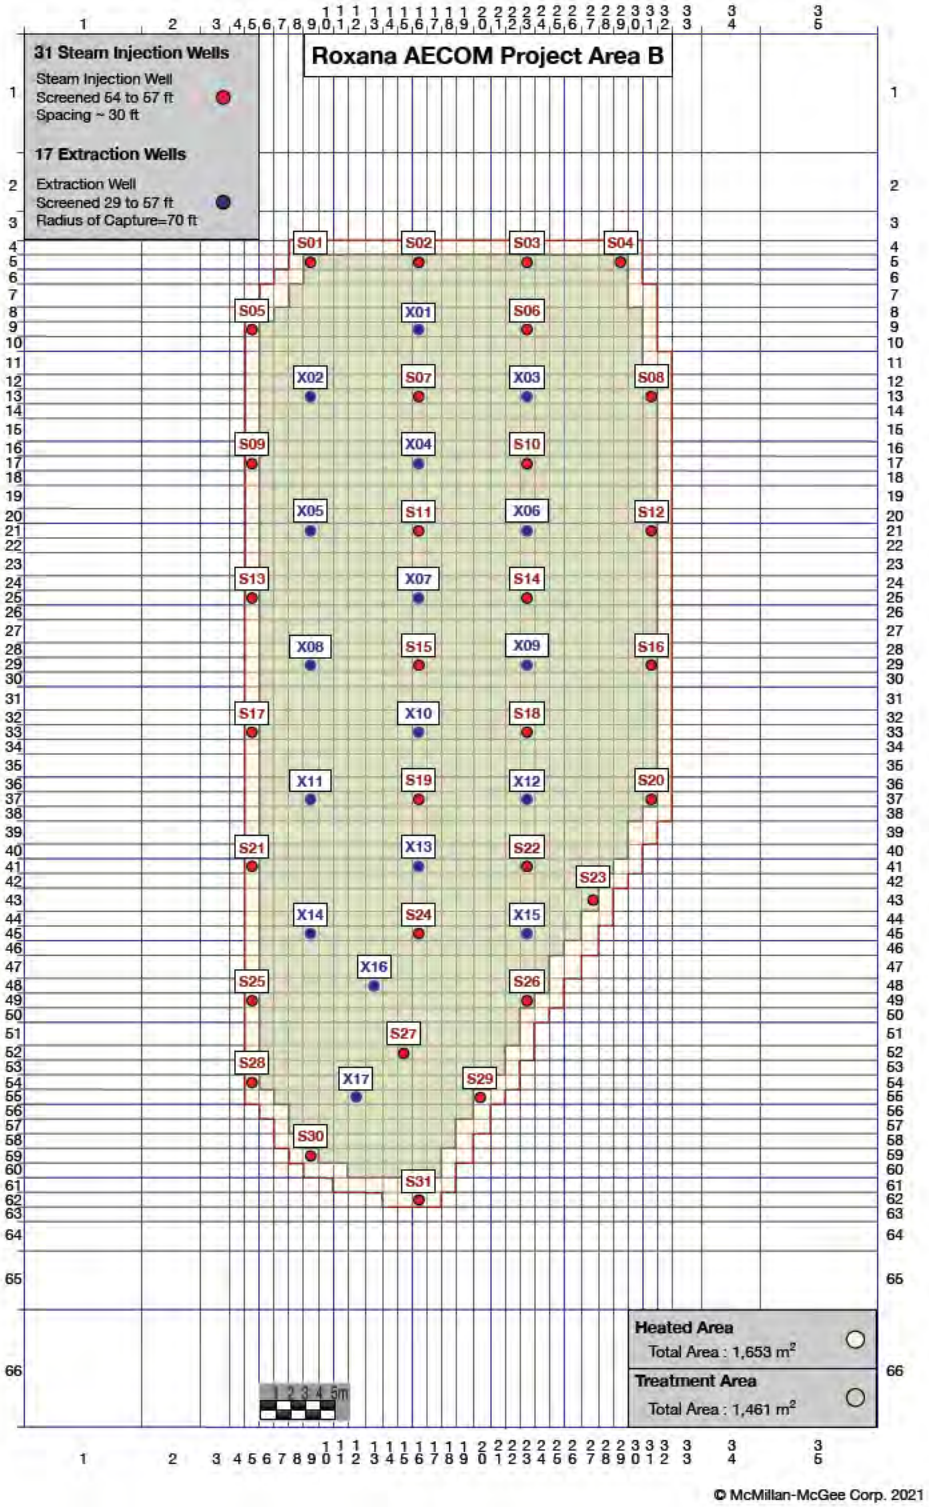

Figure 3.14.: Steam well locations in Area B.

5. The power to each steam injection well varies by location and phase of the project. However, the average power to a steam well will deliver approximately 26 kW. The peak power to a steam injection well is approximately 37 kW. This results in a total average and peak power to the well field of 2,037 kW and 2,919 kW respectively. The operating strategy will deliver maximum power to the steam wells while the temperature is increasing and reduce power while at target temperature to maintain temperatures.

   The operating strategy for each steam injection well can be found in Figures A.13 through A.16.

6. The cumulative CWE injected during thermal operations is 3,742,746 gal with an average injection rate of 14.44 gal/min.

7. The average liquid phase extraction rate is 2.924 L/min (0.772 gal/min), which accumulates into a total volume of extracted water of 25,769,756 l, (6,807,649 gal). The operating strategy for each extraction well can be found in Figures A.17 through A.20.

8. The targeted hydrodynamic control factor, the ratio of extracted water to injected water rate is, 1.588. Operating the water balance close to this control factor will ensure hydraulic control during the thermal treatment.

9. 34 extraction wells have been included for capturing vaporized contaminants from the soil and groundwater. The expected average vapor extraction rate from each well is 52.45 scfm (1.48 sm^3/min) at a vacuum pressure of less than 40.6 kPa (12 inHg). Once target temperatures are achieved, we expect the vacuum needed to achieve the vapor flow rates to decrease.

3.2. Radius of Capture Calculations

The calculations in this section provide an estimate for the maximum spacing between extraction wells recommended in the design of a SEE system and for this simulation study. It is based on solving equations, 3.1 through 3.5. The analytic model evolved from a problem submitted by McMillan-McGee to the Pacific Institute for Mathematical Sciences annual Industrial Problem Solving Workshops[5] and is in the *PIMS Industrial Proceedings*[6] authored by Huaxiong Huang et. al.[HLW03]. Figure 3.15 shows the general concept behind the model.

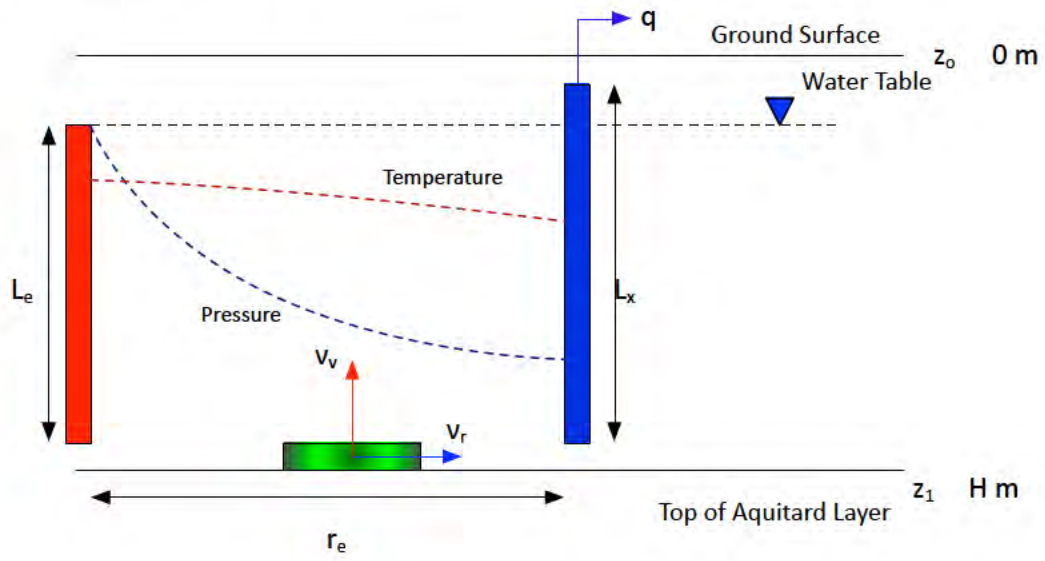

Figure 3.15.: Conceptual model for the radius of capture.

Energy is introduced to the contaminated soil using an array of finite length cylindrical steam injection wells. Energy is forced to flow though the soil by pressure differentials between the injection and extraction wells. The soil has permeability in nature and consequently heat transfer is achieved primarily by convection throughout the soil matrix.

[5]The Pacific Institute for Mathematical Sciences (PIMS) has sponsored an annual Industrial Problem Solving Workshop (IPSW) since 1997. The aim of the IPSW is to create a mutually beneficial link between researchers in industry and academic mathematical scientists. Faculty and students from the academic community study problems brought by industrial participants during the week-long workshop. Their results are presented at the end of the week.

[6]http://www.pims.math.ca/resources/publications/pims-industrial-proceedings

As the soil heats up, contaminated liquids and vapors are produced at the extraction wells. The rate of energy removed from the soil at the extraction wells is less than the steam energy injected so that during operations the soil will increase in temperature up to some maximum value, which is usually the boiling temperature of water.

At initial conditions the pressure and temperature in the soil are P_i and T_i respectively. Initially there is no vapour in the soil, only a liquid phase consisting of water, a dissolved chemical phase (the contaminant), and a free product resting on the aquitard layer. As the temperature increases toward $T = T_c$, the vapourization temperature of the chemicals in the liquid, the chemical *boils* out of the water and exists in the soil as a vapour, but only to the limited extent of several bubbles. The vapour-equilibrium for the system is estimated from $k-$values.

Given the temperature and pressure conditions in the soil it is possible to approximate where the bubbles will exist. There is a pressure gradient in the soil created by the draw-down of liquids at the extraction well. This imposes a horizontal force on the bubble and accelerates it toward the extraction well. The other force on the bubble is buoyancy, and is acting in the vertical direction. The objective of the model is to determine the horizontal velocity of the bubble so that it is removed at the extraction well before it leaves the vertical extent of the heated volume. Outside the heated volume, the bubble, comprised mainly of the DNAPL, may condense back to a liquid and reduce the efficiency of the mass recovery.

Equation 3.1 first determines the average velocity of bubbles, υ_b, as they exit the top of heated volume. The hydraulic constant for vertical flow, F, is developed in Huaxiong Huang et. al. and incorporates soil parameters into its value as indicated in Equation 3.4. The Eötvös (or Bond number), E_o, is determined in Equation 3.2 and is used to determine the capillary number, C_a, based on the correlation[BZ01] presented in Equation 3.3. Finally, the minimum liquid extraction rate needed to capture the bubbles is given in Equation 3.5.

$$\upsilon_b = \tau F \frac{\Delta \rho g d^2}{3\mu_l} \tag{3.1}$$

$$E_o = \frac{\Delta \rho g d^2}{\gamma} \tag{3.2}$$

$$C_a = c_1 E_o^{d_1} + c_2 E_o^{d_2} \tag{3.3}$$

$$F = \frac{3\phi\,(1-\alpha)}{d^3}\frac{\gamma\mu_l}{\Delta\rho g}\left(c_1 E_o^{d_1} + c_2 E_o^{d_2}\right) \tag{3.4}$$

$$q \geq \frac{\pi\,\tau F \Delta\rho g d^2}{3\mu_l} \cdot \frac{k_v\,H}{k_h\,h} \cdot \frac{r_e^2 - r_w^2}{1+K} \tag{3.5}$$

Equation 3.5 is rearranged and solved for r_e. The value of $2 \cdot r_e$ determines the maximum spacing between extraction wells that will ensure the capture of bubbles. This spacing is used as a guideline for setting up the array of extraction wells within the heated volume.

Figure 3.16 shows the radius of capture summary of the calculations for the various extraction well spacing for both treatment areas. The calculations assume the vertical permeability is half the horizontal resulting in the **maximum** spacing between extraction wells. The maximum spacing is not exceeded in this simulation study. Figures 3.17 and 3.18 show the radius of capture relative to the extraction wells in Area A and B respectively.

This is a simple model for estimating the transport of contaminants during thermal remediation. Based on the model, the maximum spacing between extraction wells is calculated and its value is within the practical range. This simple model does not address the effect of temperature variation in the vertical direction and near the edge of the heated zone. The effect of possible condensation near the cold region is not examined, however it is believed that condensed contaminant mass would find a path back into the heated volume and with time be removed at the extraction wells. The possibility that bubbles may be trapped in the isolated pore space has been assumed negligible in comparison to the mobile bubbles that are extracted. The behaviour of bubble flow in porous media, as assumed in this analysis, is further described in Hunt et. al.[HM03].

3.3. Temperature and Energy Results

Figures 3.13 and 3.14 show the 2D layout of steam and extraction wells for the simulation study.

Figures B.1 through to Figure B.6 and B.7 through to Figure B.12; (attached in Appendix B) show the simulated 3D temperature distribution calculated in increments of 30 day intervals through to the end of operations for each Area.

Figures B.13 to B.21 (attached in Appendix B) show the simulated 2D temperature distribution at the end of operations from 10 m BGS to 18 m BGS for Area A

Figures B.22 to B.22 (attached in Appendix B) show the simulated 2D temperature distribution at the end of operations from 10 m BGS to 18 m BGS for Area B.

The results confirm that subsurface temperatures needed to volatilize the chemicals of concern can be reached.

3.4. Mass Recovery Curve

The chemicals of concern in the soil are initially at equilibrium and in a liquid phase (dissolved in water or as a free product). The introduction of heat by steam energy raises the temperature sufficiently to separate the liquid mixture into multiple components in the vapour phase. This distillation of the compounds is a complicated thermodynamic process; however, at temperatures above the boiling point and induced vacuum, the volatile chemicals are in the vapour phase. Less volatile chemicals will not boil and will be extracted in the liquid phase.

From the temperature ramp-up, estimated mass in place, and experience from similar projects, the treatment plant needs to be designed to accept a peak chemical extraction rate of approximately 300 kg/day (661 lbs/day).

Figure 3.19 shows the rate of contaminant mass recovery from the target volume. The results predict that after 180 days of operation, greater than 99% of the chemical mass can be removed from the soil.

Assuming an aggregate estimated mass in place of 10,000 kg and that target temperatures within a significant volume of the treatment area will be achieved after 60 to 75 days of operations (to be conservative), (uniform target temperatures will be reached in 43 to 45 days) then peak chemical mass flow rates in excess of 300 kg/day (661 lbs/day) are expected during this period. The estimated peak chemical mass flow rate is part of the design basis for the operation of the multi-phase extraction system.

The mass recovery curve is the result of multi-function calculations using a thermodynamic model and the temperature response predicted by the numerical simulation. These calculations account for the concentrations of the chemicals and water in the liquid and vapour phases as a function of temperature and pressure using k-values. The initial increase in mass recovery shown in the curve is the result of increasing vapor phase saturations as the soil approaches target temperature. As this mass is then extracted from the pore space, the relative concentration of mass in the vapour phase decreases exponentially. Therefore, the curve calculated by the simulation is used to provide an estimate of the expected duration of treatment to achieve the remediation goals.

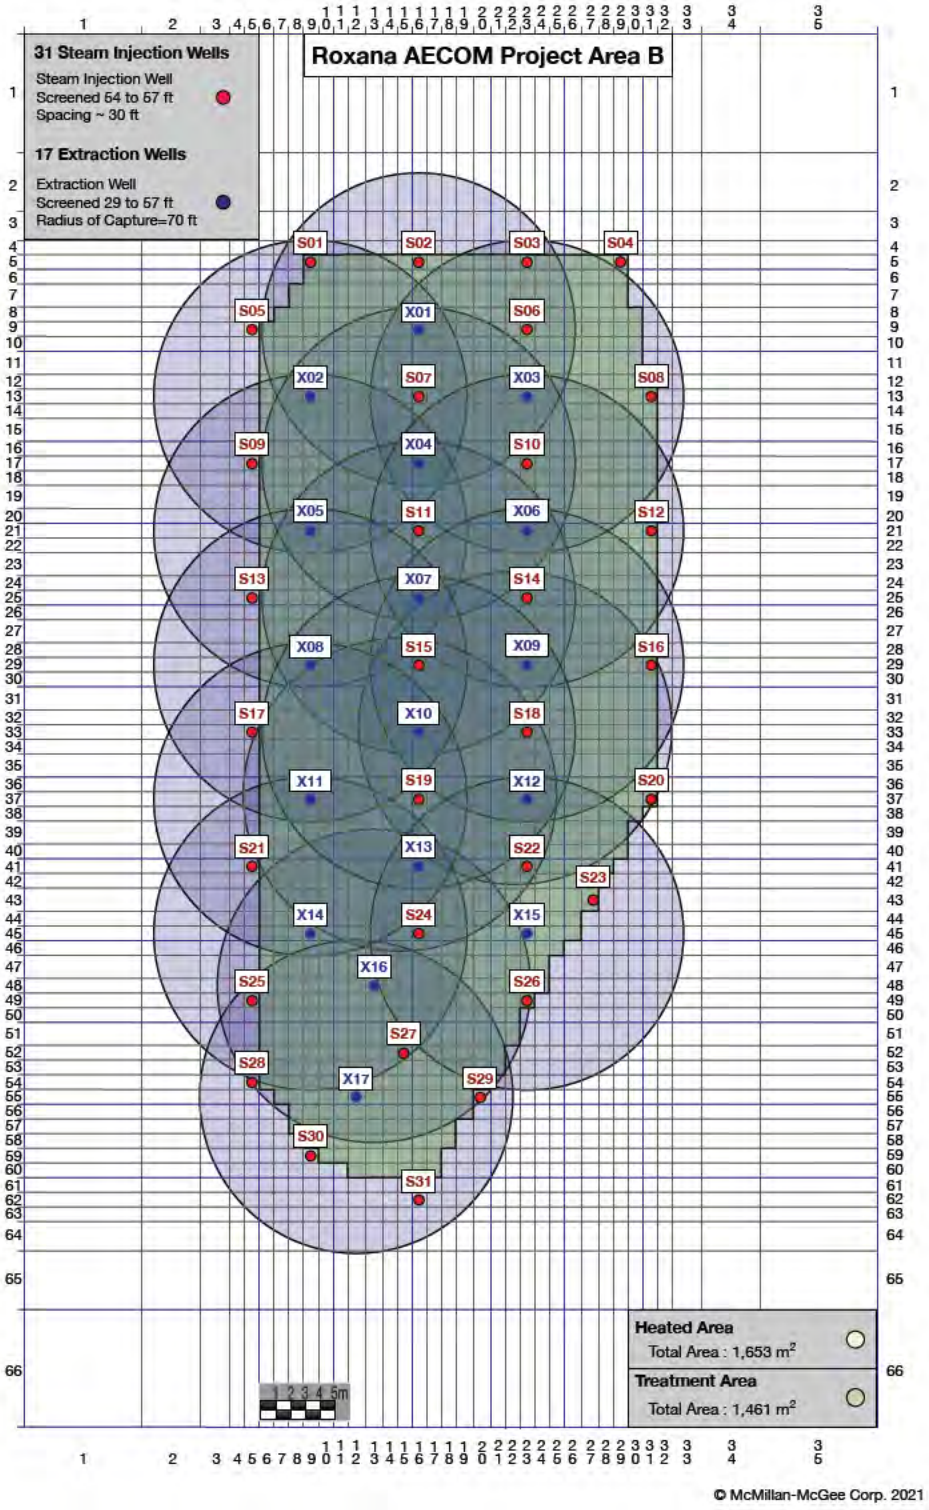

Figure 3.18.: Radius of capture r_c for XWell types in Area B.

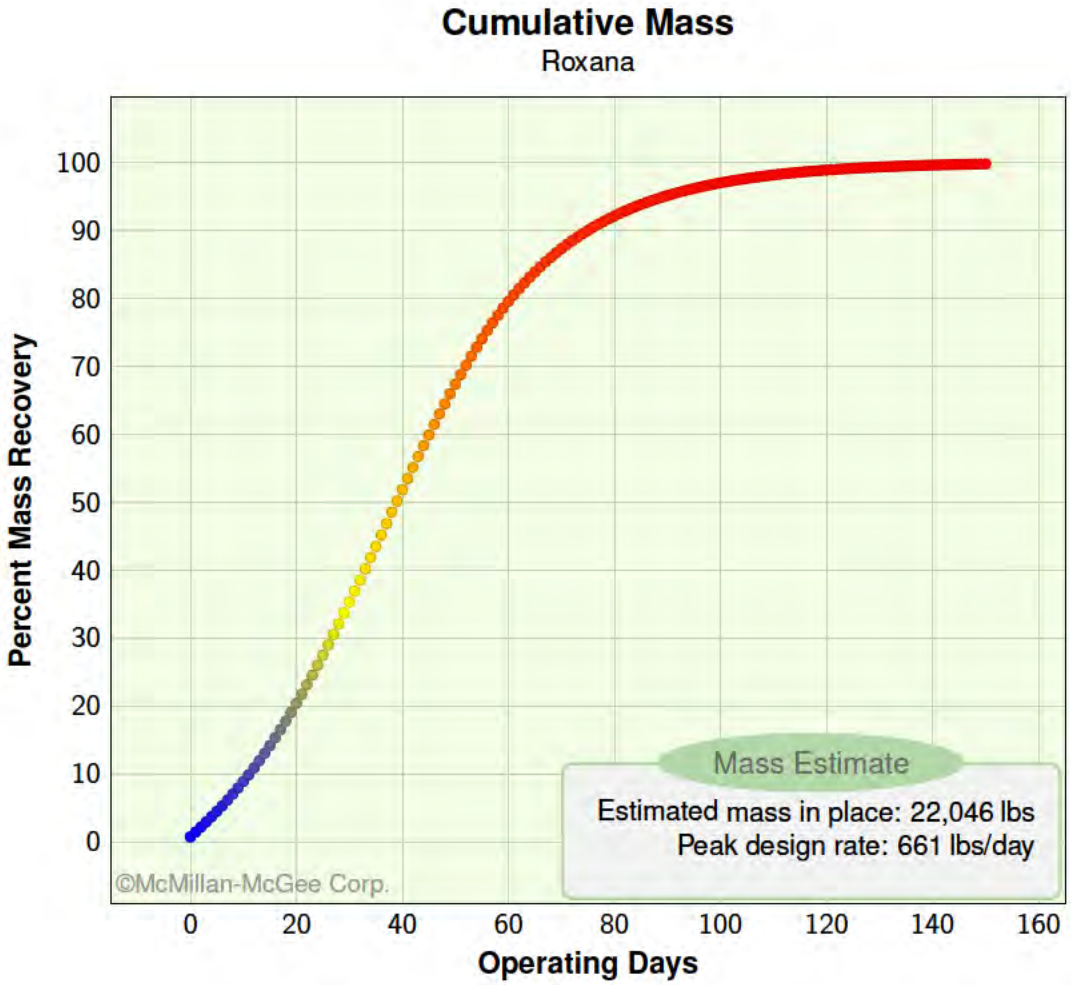

Figure 3.19.: Mass recovery curve [estimate only].

4 Conclusions

Results from the numerical simulation study are the foundation for a design basis and insight to thermal operations by quantifying several of the technical elements of the process shown in Figure 1.5 for the Roxana project. Based on these results the following conclusions and recommendations are put forward for the design of a steam injection and extraction treatment system for the project:

1. Total energy input of 8,804 MW · h or 555 kWh/m^3 (425 kWh/yd^3);
2. Total water extraction volume of 25,769,756 L (6,807,649 gallons);
3. Total water injection volume of 14,167,834 L (3,742,746 gallons);
4. Vapor extraction rate of 1,783 scfm (50.40 sm^3/min);
5. Time to reach target temperatures of 43 to 45 days in 90% of the treatment volume;
6. Peak temperatures that are generally limited to the boiling temperature of water as a function of depth and pressure in the soil[1];
7. An anticipated contaminant mass recovery of 10,000 kg (22,046 lbs);
8. Average steam well spacing of 9.14 m (30.00 ft); and,
9. A maximum extraction well spacing of 15.2 m (50.0 ft)[2].

[1]Water in the presence of chemicals will boil at the temperature of the mixture, which can be less than the co-boiling temperature of water.
[2]Extraction well spacing varies over the area of the treatment volume.

Sensor Wells	6	
Steam Well Depth	17.37 m	average depth
	57 ft	average depth
Average Steam Power	28.9 kW	changes with time
Total Average Power	896.2 kW	without ancillary power
Total Peak Power	1200 kW	
Water Injection Rate	0.000 L/min	per electrode
	0.000 gal/min	
Water Injection Rate	24.04 L/min	total
	6.35 gal/min	
Water Extraction Rate	3.49 L/min	per extraction Well
	0.923 gal/min	
Water Extraction Rate	38.18 L/min	total
	10.09 gal/min	
XWell Vapor Extraction Rate	52.45 scfm	excludes steam
Vapor Extraction Rate	891.6 scfm	excludes steam
Applied Vacuum (up to)	40.6 kPa	estimate

Figure A.6.: Roxana Area B water balance in litres.

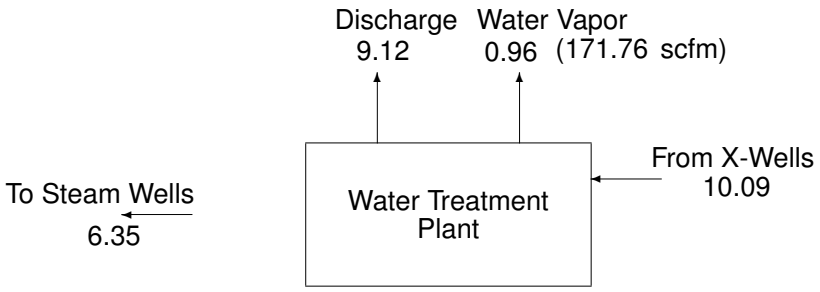

Figure A.7.: Roxana Area B water balance in gpm.

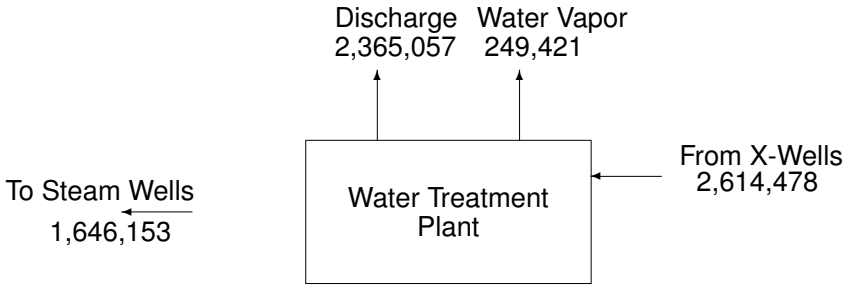

Figure A.8.: Roxana Area B water balance in gallons.

Water Balance

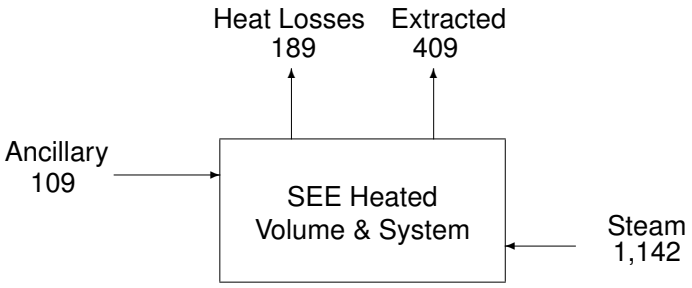
Item	Rate		Volume	
Water Plant Effluent	**L/min**	**gal/min**	**L**	**gal**
To Steam Wells	30.62	8.09	7,936,468	2,096,593
Discharge to Sewer	55.40	14.63	14,358,607	3,793,143
Vapour (CWE)	5.84	1.54	1,514,273	400,029
Water Plant Influent	**L/min**	**gal/min**	**L**	**gal**
From X-Wells	61.24	16.18	15,872,880	4,193,171
Hydraulic Ratio				$\frac{Q_X}{Q_E} = 2.000$

Table A.5.: Water balance estimates for treatment plant design - Area A.

Water Balance

Item	Rate		Volume	
Water Plant Effluent	**L/min**	**gal/min**	**L**	**gal**
To Steam Wells	24.04	6.35	6,231,366	1,646,153
Discharge to Sewer	34.54	9.12	8,952,714	2,365,057
Vapour (CWE)	3.64	0.96	944,162	249,421
Water Plant Influent	**L/min**	**gal/min**	**L**	**gal**
From X-Wells	38.18	10.09	9,896,876	2,614,478
Hydraulic Ratio				$\frac{Q_X}{Q_E} = 1.588$

Table A.6.: Water balance estimates for treatment plant design - Area B.

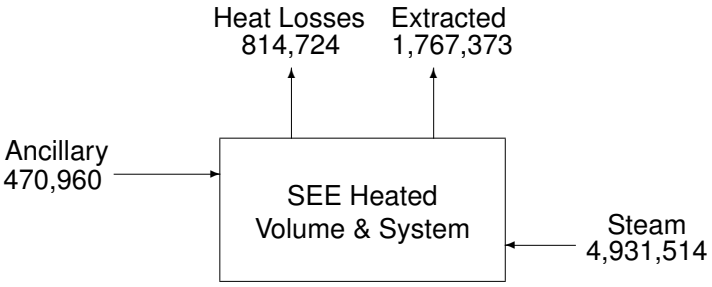


Notes:

① Ancillary power is an estimate.

② Heat loss power is determined on heat leaving the grid providing a conservative estimate for heat losses.

Figure A.9.: Roxana Area A average power flow in kW.

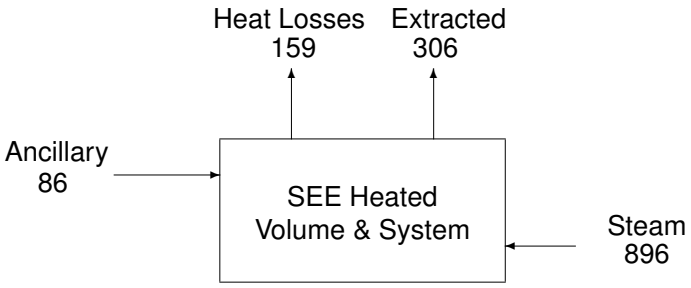


Notes:

① Calculated energy density is 374 kWh/m^3 (286 kWh/yd^3).

② Fraction of heat loss to steam energy is 12.39 percent.

Figure A.10.: Roxana Area A energy balance in kWh.

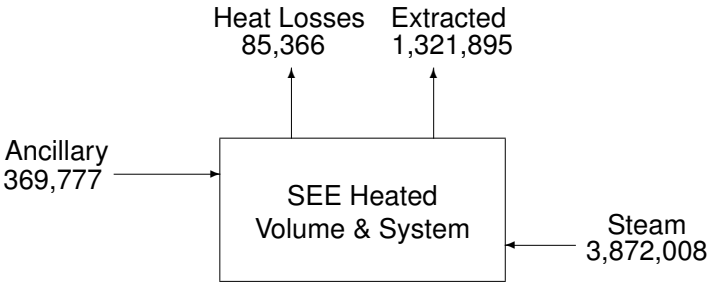


Notes:

① Ancillary power is an estimate.

② Heat loss power is determined on heat leaving the grid providing a conservative estimate for heat losses.

Figure A.11.: Roxana Area B average power flow in kW.



Notes:

① Calculated energy density is 1,449 kWh/m^3 (1,108 kWh/yd^3).

② Fraction of heat loss to steam energy is 12.39 percent.

Table C.2.: Summary of S-Wells and X-Wells.

D

Convert Hydraulic Conductivity to Darcys

$$v = \frac{k}{\mu} \cdot \frac{\Delta P}{\Delta x} = \hat{k} \cdot \frac{\Delta H}{\Delta x} \quad \left[\frac{m}{s}\right]$$

$$\Delta P = \rho g \Delta H$$

$$\frac{k \rho g}{\mu} \cdot \frac{\Delta H}{\Delta x} = \hat{k} \cdot \frac{\Delta H}{\Delta x}$$

$$\mathrm{k} = 9.869233 \cdot 10^{-13}\,\mathrm{m}^2 \text{ per Darcy,}$$

Assume properties for water

$$\mu = 0.001\ \mathrm{kg} \cdot \frac{\mathrm{m}}{\mathrm{s}^2} \frac{1}{\mathrm{m}^2} \cdot \mathrm{s}$$

$$g = 9.8\ \frac{\mathrm{m}}{\mathrm{s}^2}$$

$$\rho = \rho_w = 1{,}000\ \frac{\mathrm{kg}}{\mathrm{m}^3}$$

$$\frac{k \rho g}{\mu} = 9.671848 \cdot 10^{-6}\ \left[\frac{m}{s}\right] = 9.671848 \cdot 10^{-4}\ \left[\frac{cm}{s}\right]$$

$$\therefore \quad 1\ \left[\frac{cm}{s}\right] \equiv\ 1{,}033.9285 \text{ Darcys}$$

Heated Perimeter				
	Area A	209	m	
	Area B	167	m	
Depth of Groundwater		8	mBGS	25 to 37 ft BGS (used worst case scenario)
Porosity		36%		From AECOM Predesign Report
Solids volume		11,343	m3	
Porosity volume		6,381	m3	
Vadose zone volume		0	m3	
Initial saturation of vadose zone %V		25%	percent	
Saturated zone volume		17,724	m3	
Number of steam injection wells		81	ea	
Number of extraction wells		36	ea	
Soil weight		29,492,511	kg	2600 kg/m3
Water weight		6,367,830	kg	
Heat capacity, soil		2.00	kJ/kgC	
Heat capacity, water		4.18	kJ/kgC	
Heat capacity of soil in treatment zone		58,985,022	kJ/C	
Heat capacity of water in treatment zone		26,617,530	kJ/C	
Total heat capacity, whole TTZ		85,602,551	kJ/C	
Starting temperature of treatment zone		15	C	
Energy required to raise water to 100C		355	kJ/kg	
Energy required to raise soil to 100C		170	kJ/kg	
Groundwater heat of vapourization		2,256	kJ/kg	
Energy required to raise water to 100C		2,262,490,035	kJ	
Energy required to raise soil to 100C		5,013,726,839	kJ	
Total energy required to heat soil and water to 100C		7,276,216,874	kJ	

HEATUP <100C

Maximum Steam Injection Rate			
Boiler Horspower	366	hp	500 HP Boiler choosen based on availability and possible well additions during drilling (>1.25 SF)
Steam Quality	80	%	
Rate	4,576	kg/hr	
	56	kg/hr	
	125	lbs/hr	
Energy	10,326,176	kJ/hr	
Power	2,868	kW	
Estimated Steam Extraction			
Energy extracted as steam	20%		
	574	kW	
Extracted Water			
Extraction/Injection Ratio	2		
Extraction Rate	152	lpm	
Average Extracted Groundwater Temperature	58	C	
Extracted Water Energy	1,625,993	kJ/hr	
Power	452	kW	
Water Influx			
Width perpendicular to GW flow	143	m	Flow is west to east: 254 ft - Area A; 216 ft - Area B
Height perpendicular to GW flow	4	m	Weighted average
Depth of Groundwater	8	mBGS	
Hydraulic Conductivity	1 24E-02	cm/s	Horizontal HC - From AECOM Predesign Report
Hydraulic Gradient	3.E-03	I/l	From AECOM Predesign Report
Flux	2 E+01	m3/day	
	718	kg/hr	
Energy to heat influx water	255,060	kJ/hr	
Power	71	kW	
Conductive Heat Loss			Case at average extracted groundwater temperature
Area of sides, top, and bottom	10,407	m2	
Delta T	43	C	
Gradient Length	3.0	m	
Thermal Conductivity	2.5	W/mC	
Heat loss	369	kW	
Net energy input	1,404	kW	
Average heating rate per day	1.417	C per day	
Duration to heat to 100C	60	days	

MAINTAIN 100C

Days at temperature			
	120		180 day operations period
Steam Injection Rate			
Rate	2,226	kg/hr	
	27	kg/hr	
	61	lbs/hr	
Energy	5,022,378	kJ/hr	
Power	1,395	kW	
Estimated Steam Extraction			
Energy extracted as steam	20%		
	279	kW	
Extracted Water			
Extraction/Injection Ratio	2	E/I Ratio	
Extraction Rate	76	lpm	
Average Extracted Groundwater Temperature Difference	75	C	
Extracted Water Energy	1,116,480	kJ/hr	
Power	310	kW	
Water Influx			
Width perpendicular to GW flow	143	m	
Height perpendicular to GW flow	4	m	
Depth of Groundwater	8	mBGS	
Hydraulic Conductivity	1.E-02	cm/s	
Hydraulic Gradient	3.E-03	I/l	
Flux	2 E+01	m3/day	
	697	kg/hr	
Energy to heat influx water	247,656	kJ/hr	
Power	7 E+01	kW	
Conductive Heat Loss			Case at 100 C
Area of sides and bottom	10,407	m2	
Delta T	85	C	
Gradient Length	3.0	m	
Thermal Conductivity	2.5	W/mC	
Heat loss	737	kW	
Net Energy	0	kW	

Final Numbers

Heating Durations

Heating to 100C	60	days	
Maintain at 100 C	120	days	
Total operating time	180	days	With the contingency for heat losses and downtime
Total injected energy at well heads	8148341	kWHr	
Total energy input to boiler (83% boiler efficiency)	9817278	kWHr	

Maximum Vapour Extraction Rates

Steam production rate	915	kg/hr
Flow rate from steam if not condensed	1528.52	m3/hr
	899.65	SCFM
Non-condensable (air) to steam flow rate	1.00	
Non-Condensable Flow Rate	1528.52	m3/hr
	899.65	SCFM
Total Well field Vapour Flow Rate (air and steam)	3057.03	m3/hr
	1799.30	SCFM
	49.98	SCFM per well

Minimum Vapour Extraction Rates

Steam production rate	445	kg/hr
Flow rate from steam if not condensed	743.43	m3/hr
	437.57	SCFM
Non-condensable (air) to steam flow rate	1.00	
Non-Condensable Flow Rate	743.43	m3/hr
	437.57	SCFM
Total Well field Vapour Flow Rate (air and steam)	1486.86	m3/hr
	875.13	SCFM
	24.31	SCFM per well

Liquid Extraction Rate

Maximum	152	lpm
	40.22	gpm
	3475143.57	gallons
Minimum	76	lpm
	19.99	gpm
	3455031.737	gallons

Steam Injection

Maximum	4,576	kg/hr
	10090.95	lbs/hr
	124.58	lbs/hr
Minimum	2,226	kg/hr
	4907.97	lbs/hr
	60.59	lbs/hr

CWE Injection

1743716.06	gallons	First 60 days
1696194.446	gallons	120 remaining days
3439910 506	gallons	Total

Vapor Flow Calculation

Item	Symbol	Value	Units	Comment
Input				
Vacuum at edge of treatment area	V_{edge}	0.00	in. of Hg	Es imated
Vacuum at X-Well	V_{well}	12.00	in. of Hg	Es imated
Exposed screen length	b	1.0	ft	Per unit length of screen
		0.3	m	
Hydraulic Conductivity	K	1.20E-02	cm/s	From Predesign Investigation Report (AECOM)
Permeability	k	12,396.7	mD	1 mD ~ 1.0E-6 cm/s
		1.18E-11	m^2	
Density of air	ρ_{air}	1.2	kg/m^3	
Gas Constant	R_{air}	287	$m^2/s^2{}^\circ K$	
Temperature	T_{air}	20	°C	Ambient temperature assumption
		293	°K	°K = °C + 273
Viscosity of air	μ_{air}	1.846E-05	kg/m·s	
Radial distance from X-Well	r_{edge}	20.50	ft	Based on extraction well layout
		6.2	m	
Radius of X-Well	r_w	0.0508	m	4" diameter well screen
Calculation of Flow Rate per Unit Length of Screen				
Pressure away from X-Well	P_{edge}	101,325.0	Pa ($kg/m·s^2$)	Calculated from vacuum at edge of treatment area
		101.3	kPa	
		0.0	in. of Hg	Input data
		0.0	in. of water	1 in. Hg = 13.6 in. water
		0.0	psi	1 in. Hg = 0.49 psi
Pressure at X-Well	P_{well}	60,688.2	Pa ($kg/m·s^2$)	Calculated from vacuum at X-Well
		60.7	kPa	
		12.0	in. of Hg	Input data
		163.2	in. of water	1 in. Hg = 13.6 in. water
		5.9	psi	1 in. Hg = 0.49 psi
Flow Rate per Linear Foot Screen	Q	**0.00829**	**m^3/s**	$Q = [-(P_{edge}^2-P_{well}^2)]*[(\Pi*b*k)/(\rho_{air}*R_{air}*T*\mu_{air}*\ln(r_{well}/r_{edge}))]$
		17.56	**ft^3/min**	
Calculation of Flow Rate for Entire Well Field				
Flow Rate	Q	**3.460**	**m^3/s**	Calculated 394 ft of well screen exposed in the vadose zone, based on ten years of water level observa ions
		7,328.4	**ft^3/min**

digiTAM™ Temperature Acquisition Module

digiTAM ™
Sensor String Specifications

Temperature	Principle	Integrated silicon temperature sensors
	Range Accuracy Resolution	-55 to 125°C ±0.7 °C ±0.125 °C
Environmental	Media compatibility	Air, water, steam, fuels, oils (Contact Mc² for specific contaminants)
	Wetted material	Gasoline Hose or Stainless Steel
Dimensions	Bottom Seal	1-1/16" (max)
	Cable	1/2 "
	Sensor interval (typ)	3.0 ft or 1.0 m
Weight	Cable	50g/ft.
Connection	Power	External supply, 3.0 to 5.5 V DC; no batteries needed Power consumption of 7.5 mW per sensor during measurement
	Communication	Data acquisition occurs using Mc²'s 3 line digital serial bus Individual temperature measurements occur within 750 ms Data immediately accessible via the internet
	Sensor string	Placed in a drop-tube at required depth and anchored to surface
	Data server	Data lines connected with CAT5 cable Connects to site server through Mc² communication hub

Networking
Multiple digiTAMs are accessed from a data server using Mc²'s communication protocols. Temperatures are immediately accessible via the Internet.

Easily Powered
DigiPAMs require only 7.5 mW of power per sensor during temperature conversions. External power supply over the 3 line digital bus means no batteries are required.

Digital at the Source
The temperatures are converted directly to digital signals to limit the effects of high electromagnetic interference due to thermal remediation systems. DigiTAMs and digiPAM pressure sensors are connected on the same digital bus for simple installation, automated process monitoring and real-time data access.

Instantaneous Temperature Profiling
The digiTAM strings make use of multiple temperature sensors on a common 3 line digital bus. Typically 30 temperature sensors are embedded in the Santoprene cable at 2.5 ft intervals. Thus a complete temperature profile is obtained for a narrow borehole within seconds.

Extreme Environments
DigiTAMs are fully submersible and measure temperatures of up to 125°C. The sensor is compatible with most chemical contaminants seen at remediation sites.

Fast Installation
DigiTAMs are simply lowered into a monitoring well and anchored to the surface. The sensor is linked to the data server using standard CAT5 network cable and Mc²'s communication.

COMMENTS (MAY CONTINUE ON NEXT PAGE)

[1]Approximate operating pressure at the manifold inlet for initial start-up. Final pressure should be determined after checking actual flow with gas meter. Stack temperature, CO, CO_2, O_2, and furnace pressure will help in determining actual input when gas meter is not available for this unit.

[2]All components are rated for the maximum design pressure specified. That pressure must not be exceeded.

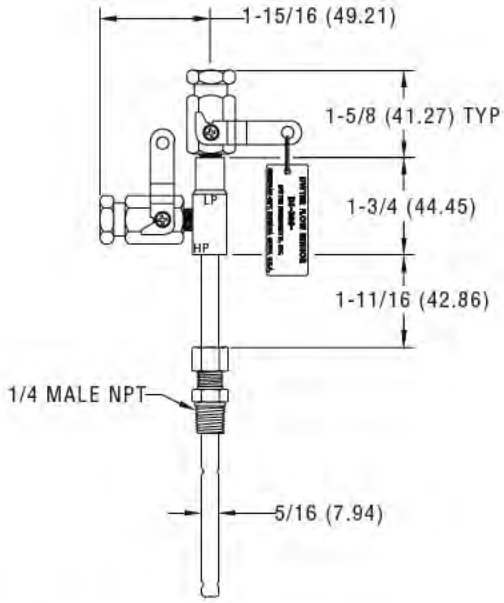
Series DS-300 Flow Sensors

Installation and Operating Instructions Flow Calculations



Series DS-300 Flow Sensors are averaging pitot tubes that provide accurate, convenient flow rate sensing. When purchased with a Dwyer Capsuhelic® for liquid flow or Magnehelic® for air flow, differential pressure gage of appropriate range, the result is a flow-indicating system delivered off the shelf at an economical price. Series DS-300 Flow Sensors are designed to be inserted in the pipeline through a compression fitting and are furnished with instrument shut-off valves on both pressure connections. Valves are fitted with 1/8″ female NPT connections. Accessories include adapters with 1/4″ SAE 45° flared ends compatible with hoses supplied with the Model A-471 Portable Capsuhelic® kit. Standard valves are rated at 200°F (93.3°C). Where valves are not required, they can be omitted at reduced cost. Series DS-300 Flow Sensors are available for pipe sizes from 1″ to 10″.

INSPECTION

Inspect sensor upon receipt of shipment to be certain it is as ordered and not damaged. If damaged, contact carrier.

INSTALLATION

General - The sensing ports of the flow sensor must be correctly positioned for measurement accuracy. The instrument connections on the sensor indicate correct positioning. The side connection is for total or high pressure and should be pointed upstream. The top connection is for static or low pressure.

Location - The sensor should be installed in the flowing line with as much straight run of pipe upstream as possible. A rule of thumb is to allow 10 - 15 pipe diameters upstream and 5 downstream. The table below lists recommended up and down piping.

PRESSURE AND TEMPERATURE

Maximum: 200 psig (13.78 bar) at 200°F (93.3°C).

Upstream and Downstream Dimensions in Terms of Internal Diameter of Pipe*

Upstream Condition	Minimum Diameter of Straight Pipe		
	Upstream		Downstream
	In-Plane	Out of Plane	
One Elbow or Tee	7	9	5
Two 90° Bends in Same Plane	8	12	5
Two 90° Bends in Different Plane	18	24	5
Reducers or Expanders	8	8	5
All Valves**	24	24	5

* Values shown are recommended spacing, in terms of internal diameter for normal industrial metering requirements. For laboratory or high accuracy work, add 25% to values.

** Includes gate, globe, plug and other throttling valves that are only partially opened. If valve is to be fully open, use values for pipe size change. **CONTROL VALVES SHOULD BE LOCATED AFTER THE FLOW SENSOR.**

POSITION

Be certain there is sufficient clearance between the mounting position and other pipes, walls, structures, etc, so that the sensor can be inserted through the mounting unit once the mounting unit has been installed onto the pipe.

Flow sensors should be positioned to keep air out of the instrument connecting lines on liquid flows and condensate out of the lines on gas flows. The easiest way to assure this is to install the sensor into the pipe so that air will bleed into, or condensate will drain back to, the pipe.

For Air or Gas Flow

Install in upper quadrant of pipe

Condensate drains back to pipe

For Liquid or Steam Flow

Install in lower quadrant of pipe

Air bleeds back to pipe

INSTALLATION

1. When using an A-160 thred-o-let, weld it to the pipe wall. If replacing a DS-200 unit, an A-161 bushing (1/4˝ x 3/8˝) will be needed.

2. Drill through center of the thred-o-let into the pipe with a drill that is slightly larger than the flow sensor diameter.

3. Install the packing gland using proper pipe sealant. If the packing gland is disassembled, note that the tapered end of the ferrule goes into the fitting body.

4. Insert sensor until it bottoms against opposite wall of the pipe, then withdraw 1/16˝ to allow for thermal expansion.

5. Tighten packing gland nut finger tight. Then tighten nut with a wrench an additional 1-1/4 turns. Be sure to hold the sensor body with a second wrench to prevent the sensor from turning.

INSTRUMENT CONNECTION

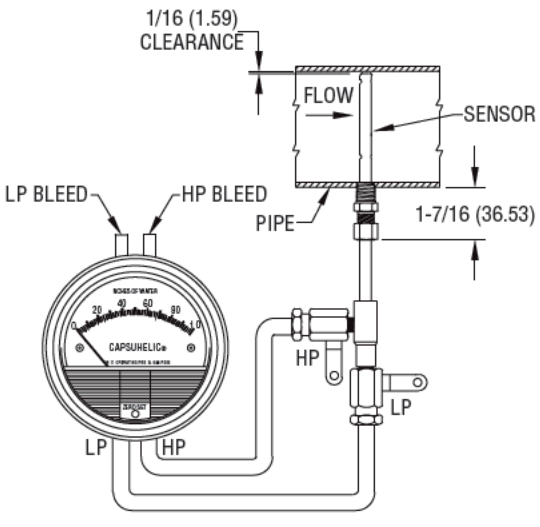
Connect the slide pressure tap to the high pressure port of the Magnehelic® (air only) or Capsuhelic® gage or transmitting instrument and the top connection to the low pressure port.

See the connection schematics below.

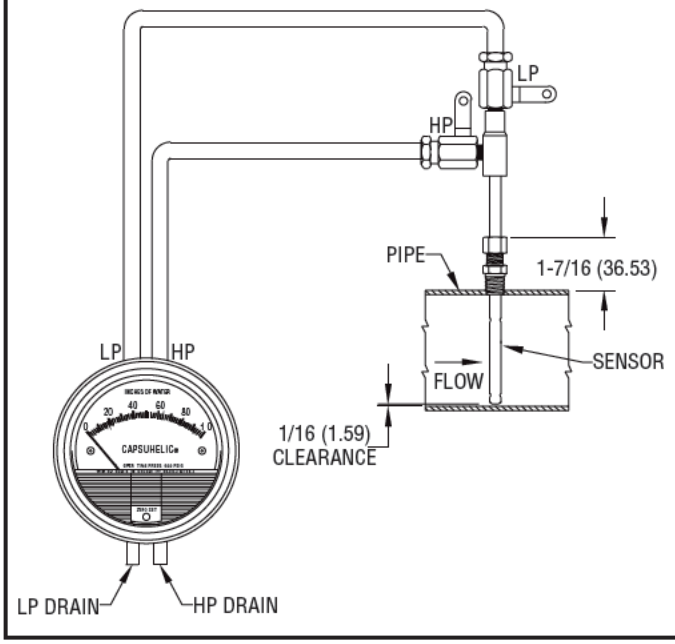
Bleed air from instrument piping on liquid flows. Drain any condensate from the instrument piping on air and gas flows.

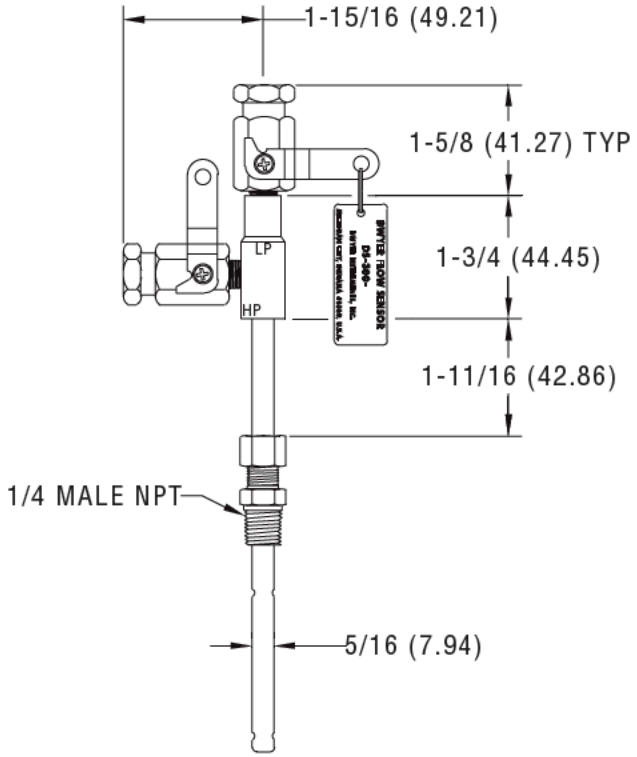
Open valves to instrument to place flow meter into service. For permanent installations, a 3-valve manifold is recommended to allow the gage to be zero checked without interrupting the flow. The Dwyer A-471 Portable Test Kit includes such a device.

Water Flow



Air or Gas Flow





Flow Calculations and Charts

The following information contains tables and equations for determining the differential pressure developed by the DS-300 Flow Sensor for various flow rates of water, steam, air or other gases in different pipe sizes.

This information can be used to prepare conversion charts to translate the differential pressure readings being sensed into the equivalent flow rate. When direct readout of flow is required, use this information to calculate the full flow differential pressure in order to specify the exact range of Dwyer Magnehelic® or Capsuhelic® gage required. Special ranges and calculations are available for these gages at minimal extra cost. See bulletins A-30 and F-41 for additional information on Magnehelic® and Capsuhelic® gages and DS-300 flow sensors.

For additional useful information on making flow calculations, the following service is recommended: Crane Valve Co. Technical Paper No. 410 “Flow of Fluids Through Valves, Fittings and Pipe.” It is available from Crane Valve Company, www.cranevalve.com.

Using the appropriate differential pressure equation from Page 4 of this bulletin,calculate the differential pressure generated by the sensor under normal operating conditions of the system. Check the chart below to determine if this value is within the recommended operating range for the sensor. Note that the data in this chart is limited to standard conditions of air at 60°F (15.6°C) and 14.7 psia static line pressure or water at 70°F (21.1°C). To determine recommended operating ranges of other gases, liquids an/or operating conditions, consult factory.

Note: the column on the right side of the chart which defines velocity ranges to avoid. Continuous operation within these ranges can result in damage to the flow sensor caused by excess vibration.

Pipe Size (Schedule 40)	Flow Coefficient “K”	Operating Ranges Air @ 60°F & 14.7 psia (D/P in. W.C.)	Operating Ranges Water @ 70°F (D/P in. W.C.)	Velocity Ranges Not Recommended (Feet per Second)
1	0.52	1.10 to 186	4.00 to 675	146 to 220
1-1/4	0.58	1.15 to 157	4.18 to 568	113 to 170
1-1/2	0.58	0.38 to 115	1.36 to 417	96 to 144
2	0.64	0.75 to 75	2.72 to 271	71 to 108
2-1/2	0.62	1.72 to 53	6.22 to 193	56 to 85
3	0.67	0.39 to 35	1.43 to 127	42 to 64
4	0.67	0.28 to 34	1.02 to 123	28 to 43
6	0.71	0.64 to 11	2.31 to 40	15 to 23
8	0.67	0.10 to 10	0.37 to 37	9.5 to 15
10	0.70	0.17 to 22	0.60 to 79	6.4 to 10

FLOW EQUATIONS

1. Any Liquid

$$Q\ (GPM) = 5.668 \times K \times D^2 \times \sqrt{\Delta P / S_f}$$

2. Steam or Any Gas

$$Q\ (lb/Hr) = 359.1 \times K \times D^2 \times \sqrt{p \times \Delta P}$$

3. Any Gas

$$Q\ (SCFM) = 128.8 \times K \times D^2 \times \sqrt{\frac{P \times \Delta P}{(T + 460) \times S_s}}$$

DIFFERENTIAL PRESSURE EQUATIONS

1. Any Liquid

$$\Delta P\ (in.\ WC) = \frac{Q^2 \times S_f}{K^2 \times D^4 \times 32.14}$$

2. Steam or Any Gas

$$\Delta P\ (in.\ WC) = \frac{Q^2}{K^2 \times D^4 \times p \times 128{,}900}$$

3. Any Gas

$$\Delta P\ (in.\ WC) = \frac{Q^2 \times S_s \times (T + 460)}{K^2 \times D^4 \times P \times 16{,}590}$$

Technical Notations

The following notations apply:

ΔP = Differential pressure expressed in inches of water column
Q = Flow expressed in GPM, SCFM, or PPH as shown in equation
K = Flow coefficient— See values tabulated on Pg. 3.
D = Inside diameter of line size expressed in inches.

For square or rectangular ducts, use: $D = \sqrt{\frac{4 \times \text{Height} \times \text{Width}}{\pi}}$

P = Static Line pressure (psia)
T = Temperature in degrees Fahrenheit (plus 460 = °Rankine)
p = Density of medium in pounds per square foot
S_f = Sp Gr at flowing conditions
S_s = Sp Gr at 60°F (15.6°C)

SCFM TO ACFM EQUATION

$$\text{SCFM} = \text{ACFM} \times \left(\frac{14.7 + \text{PSIG}}{14.7}\right) \left(\frac{520^*}{460 + °F}\right)$$

$$\text{ACFM} = \text{SCFM} \times \left(\frac{14.7}{14.7 + \text{PSIG}}\right) \left(\frac{460 + °F}{520}\right)$$

$$\text{POUNDS PER CUBIC FOOT STD.} = \text{POUNDS PER CUBIC FOOT ACT.} \times \left(\frac{14.7}{14.7 + \text{PSIG}}\right) \left(\frac{460 + °F}{520^*}\right)$$

$$\text{POUNDS PER CUBIC FOOT ACT.} = \text{POUNDS PER CUBIC FOOT STD.} \times \left(\frac{14.7 + \text{PSIG}}{14.7}\right) \left(\frac{520^*}{460 + °F}\right)$$

1 Cubic foot of air = 0.076 pounds per cubic foot at 60° F (15.6°C) and 14.7 psia.
* (520°= 460 + 60°) Std. Temp. Rankine

STEAM HOSE

Note: *All steam hoses will last longer if they are drained after each use. Water that is left in steam hose tends to be absorbed into the tube compound. When the hose is rapidly reheated, the condensed moisture vaporizes in the rubber compound causing blistering of the tube. In general, steam hoses are not a substitute for steel piping and should not be used in manifold systems or any other permanent installation.*

Weld

G571... EPDM STEAM

G571 features a braided steel wire reinforcement which allows better retention to crimped fittings as opposed to clamped fittings when assembled. It is suitable for conveying saturated steam to 250 psi.

Tube: Smooth, black, electrically conductive EPDM rubber.

Reinforcement: Braided layers of high-tensile steel wire.

Cover: Wrapped finish, red, abrasion, weather, and heat resistant EPDM rubber.

Temperature Range: -40°C (40°F) to 210°C (410°F) for steam, 95°C (205°F) for hot water.

Couplings: Only G29 series crimpable ground joint stems should be used. Always use G29CR crimp ferrules to prevent stem blowout. For pipe thread, please use Pulsar 4400 Series Crimp Fittings.

Clamp Selection Chart:

2	G571-200	2.64	250	1.44	50 or 100	

G572... RED DEVIL

Red Devil is manufactured using layers of high-tensile spiral wire for extra flexibility and with a heavy, wrapped cover for durability. It is rated for saturated steam to 250 psi and is our most popular steam hose for heavy industrial applications.

Tube: Black EPDM rubber compounded for high resistance to heat aging.

Reinforcement: Spiral layers of brass-plated, high-tensile, steel wire.

Cover: Wrapped finish, red, abrasion, weather, and heat resistant EPDM rubber, pin-pricked to prevent blistering.

Temperature Range: -40°C (-40°F) to 208°C (406°F) ...short peaks to 232°C (450°F).

Couplings: Only G29 series ground joint or G23 series male NPT stems should be used. Always use G29C series interlocking clamps to prevent stem blowout.

STEAM HOSE

Note: *All steam hoses will last longer if they are drained after each use. Water that is left in steam hose tends to be absorbed into the tube compound. When the hose is rapidly reheated, the condensed moisture vaporizes in the rubber compound causing blistering of the tube. In general, steam hoses are not a substitute for steel piping and should not be used in manifold systems or any other permanent installation.*

G573... CHLOROBUTYL STEAM

Chlorobutyl rubber has excellent heat resistance and is less permeable to gases than other synthetic rubbers. These characteristics provide for a steam hose with improved life expectancy. Not only does the tube compound not age so quickly, but it absorbs much less steam. When steam hoses cycle from hot to cold, the steam that has been absorbed into the steam hose tube condenses. When it is suddenly re-heated, the water can vaporize and cause tiny "explosions" into the tube. The result is an effect called "popcorning" where the hose bore appears to have bubbled. Chlorobutyl rubber has improved resistance to this effect.

Tube: Black Chlorobutyl rubber compounded for high resistance to heat aging.

Reinforcement: Spiral layers of brass-plated, high-tensile, steel wire.

Cover: Wrapped finish, red, abrasion, weather, and heat resistant EPDM rubber, pin-pricked to prevent blistering.

Temperature Range: -40°C (-40°F) to 208°C (406°F) ...short peaks to 232°C (450°F).

Couplings: Only G29 series ground joint or G23 series male NPT stems should be used. Always use G29C series interlocking clamps to prevent stem blowout.

STEAM HOSE ASSEMBLIES

Steam hoses are supplied with G29C interlocking clamps for secure fitting retention. Fittings are generally G29 ground joint style stems with wing nuts or G23S male pipe stems. These fittings all have collars on the barb to interlock with the G29C clamp. For crimped steam hose assemblies, Green Line offers our G571 product line complete with NPT or G29 Crimpable Ground Joint fittings.

SECTION 7200
ENGINEERING SPECIFICATION: AIR STRIPPER BLOWER

PART 1— GENERAL

1.1 SCOPE

1.1.1 The manufacturer shall furnish a blower for use with a low profile, multi-tray Air Stripper.

1.2 PROCESS DESCRIPTION

1.2.1 The blower impeller, driven by the direct-coupled motor, pressurizes air and supplies it to the stripper with sufficient flow and pressure to generate a froth of bubbles in the water contained by up to six stripper trays.

1.3 SUBMITTALS

1.3.1 Manufacturer shall submit the following with the bid:

1.3.1.1 Product data for selected model, including rated output capacity, electrical specifications, and warranty coverage. See attached Data Sheet for full specification.

PART 2 — PRODUCTS

2.1 GENERAL

2.1.1 The blower shall be a direct drive pressure blower (scroll type or a direct drive regenerative type blower. See Data Sheet for model number. Equipment shall be supplied by QED Environmental Systems, Inc. and represented by _____ or pre-approved equivalent.

2.1.2 Blower design and performance shall meet requirements specified on the Data Sheet attached to this specification.

2.2 EQUIPMENT DESIGN REQUIREMENTS-DIRECT DRIVE BLOWER

2.2.1 Standard product design shall include one pressure blower with all-welded steel housing and aluminum wheel, with the following specifications:

REV 010122 Copyright 2001 QED

2.2.1.1 Blower shall be an industrial quality model rated for continuous duty, certified and licensed to bear the AMCA (Air Movement and Control Association, Inc.) Seal, in accordance with AMCA Publication 211.

2.2.1.2 Blower shall be factory balanced and motor-coupled.

2.2.1.3 Blower shall be supplied with an air flow throttle, factory installed preset to match stripper system requirements, and labeled to indicate settings for clean operation, turn-up range, and overload conditions.

2.2.1.4 Blower inlet shall be equipped with a 90° elbow serving as an inlet safety guard, ready for connection to an air inlet duct if desired.

2.2.1.5 Blower shall include a built-in water drain.

2.2.2 Standard product design shall include one industrial quality (such as Baldor, GE or preapproved equal) electric motor, with the following specifications:

2.2.2.1 Blower-motor unit shall be a compact, direct-drive arrangement with the blower wheel mounted directly on motorshaft, to minimize the number of moving parts and for ease of maintenance.

2.2.2.2 Motor must meet the system's electrical voltage/phase and explosion-proof requirements (if applicable). See attached Data Sheet for specifications.

2.2.3 Standard product design shall include outlet ducting to connect the blower outlet flange to the stripper inlet ducting. Duct size and design shall be sufficient to allow the blower to operate at full capacity. Duct design shall include a section routed high to prevent water from reaching the blower in the event of a system shutdown.

2.2.4 Blower/motor unit shall be primed and painted.

2.3 EQUIPMENT DESIGN REQUIREMENTS-REGENERATIVE BLOWER

2.3.1 Standard product design shall include one regenerative blower with cast rather than fabricated aluminum impeller (for ruggedness), housing and cover, meeting the following specifications:

REV 010122 Copyright 2001 QED

2.3.1.1 Blower shall be an industrial quality model rated for continuous duty at the required workload.

2.3.1.2 Blower shall be factory balanced and motor-coupled. Blower shall be equipped with a Teflon shaft seal, final assembly leak tested to less than 1cc/sec @ 3 psi.

2.3.1.3 Blower shall be supplied with an air flow throttle, factory installed preset to match stripper system requirements, and labeled to indicate settings for clean operation, turn-up range, and overload conditions.

2.3.1.4 Blower shall be equipped with an inlet filter and integral intake and exhaust mufflers, held in place with a screen (spring or wire hold-down is not acceptable), to minimize operating noise levels.

2.3.1.5 Inlet and outlet flanges shall be of cast iron; soft metals, such as aluminum are not allowed.

2.3.2 Standard product design shall include one industrial quality UL and CSA approved electric motor, with the following specification:

2.3.2.1 Blower-motor unit shall be a maintenance-free, compact direct-drive arrangement.

2.3.2.2 Motor must meet the system's electrical voltage/phase and explosion-proof requirements (if applicable). See attached Data Sheet for specifications.

2.3.2.3 Motor must be rated for continuous duty and carry full rated load at temperatures below insulation limits; motor ball bearings shall be double sealed with a rated life of not less than 20,000 hours continuous duty at the maximum rated blower load.

2.3.3 Standard product design shall include outlet ducting to connect the blower outlet flange to the stripper inlet ducting. Duct size and design shall be sufficient to allow the blower to operate at full capacity. Duct design shall include a section routed high to prevent water from reaching the blower in the event of a system shutdown.

2.3.4 Blower/motor unit shall be primed and painted.

2.4 OPERATION AND PERFORMANCE PARAMETERS

2.4.1 Blower shall be sized to allow turn-up to overcome fouling of the stripper, extending the time between cleanings. See Data Sheet for output curves.

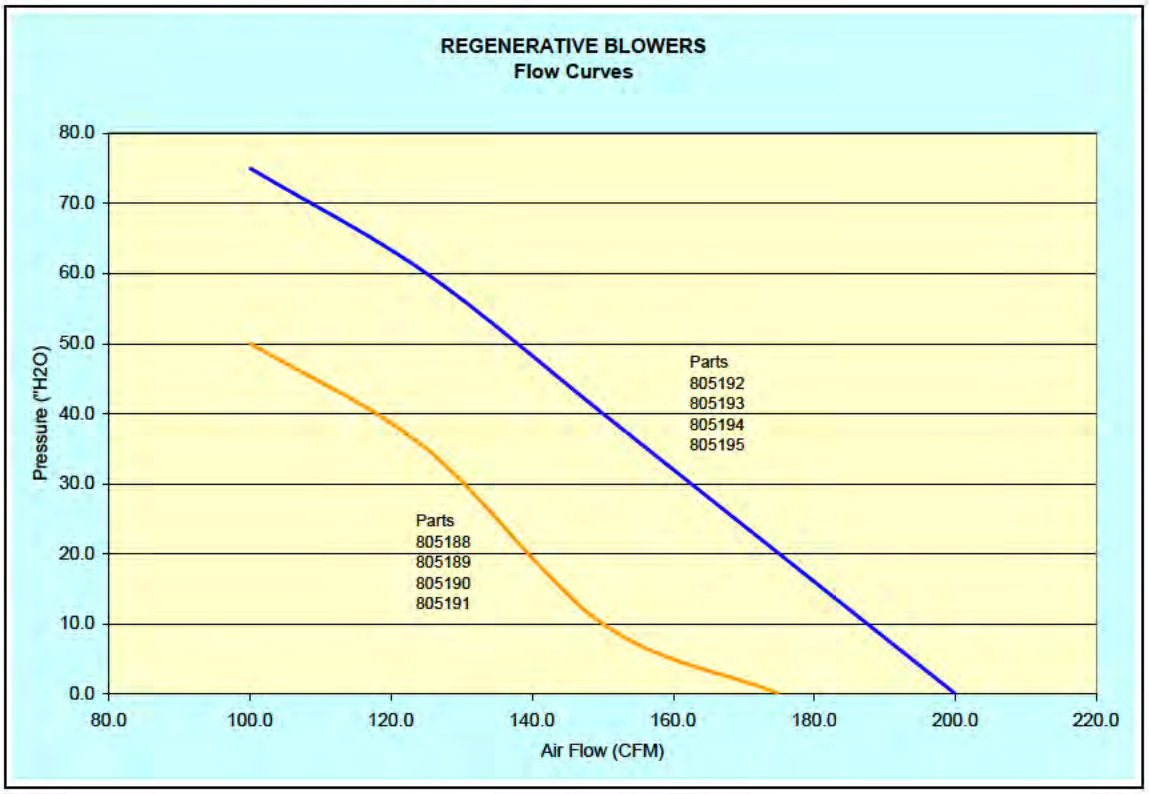
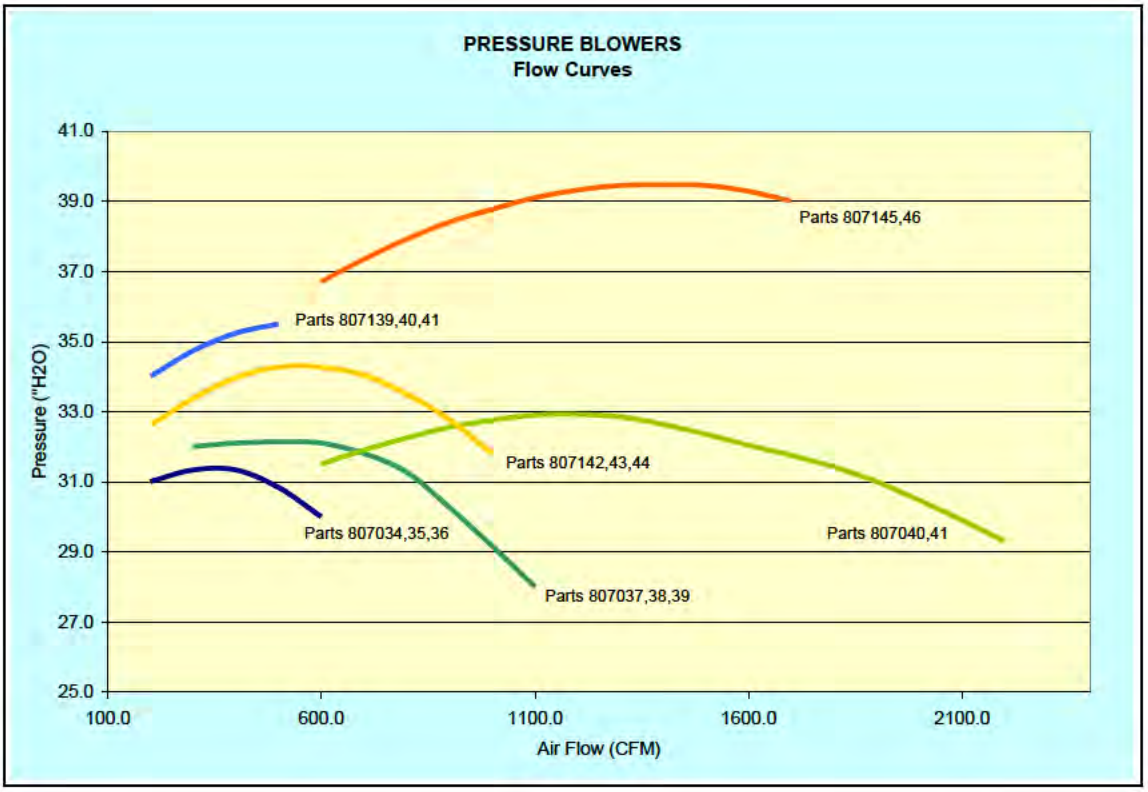
2.4.1 BLOWER OUTPUT CURVES





REV 010122 Copyright 2001 QED

SECTION 0200
ENGINEERING SPECIFICATION: CONTROL PANEL

PART 1— GENERAL

1.1 SCOPE

1.1.1 Manufacturer shall furnish an industrial control panel for use with a ground water treatment system.

1.2 DESCRIPTION

1.2.1 The control panel controls all motor-driven and other electrically operated equipment comprising the remediation system. The various components are fully interlocked for fail-safe operation. The operation of all driven components can be manually overridden for equipment startup or troubleshooting. The status of all components and alarms is indicated via illuminated devices located on the door of the enclosure, or on the swing-out panel of dead-front panels.

1.3 SUBMITTALS

1.3.1 Manufacturer shall submit the following with the bid:

1.3.1.1 Product data for selected model, including standard features, options, and warranty coverage. See attached Data Sheet for full specification.

PART 2 — PRODUCTS

2.1 GENERAL

2.1.1 System shall be manufactured by QED Environmental Systems, Inc. and represented by _____ or pre-approved equivalent.

2.1.2 Control panel design and performance shall meet requirements specified on the attached Data Sheet.

2.2 EQUIPMENT DESIGN REQUIREMENTS

2.2.1 Control panel shall be designed and built to UL508 Industrial Control Panel requirements.

REV 3/13/15 COPYRIGHT 2015 QED

2.2.2 Control panel shall be manufactured in a listed Industrial Control Panel Manufacturing Facility.

2.2.3 Control panel enclosure shall be a Type 4 as required for the application.

2.2.4 Control panel components shall be industrial quality
- IEC style motor starters
- fuses
- transformers
- timing relays
- intrinsically safe components (as required)

2.2.5 Control panel shall include the following list of features as standard equipment:
Control panel transformer (if required)
Green illuminated selector switch for control and run indicator for each motor
Red pilot light for each alarm condition
Main disconnect switch, externally accessible
IEC-style motor starters
Mounting kit
Alarm interlock dry contacts
Intrinsically safe components and circuits if site conditions require

2.2.6 The following options shall be available (see Data Sheet for specifications):
Alarm beacon and/or horn
Blank front panel
Control interlocks for other on-site equipment
Lightning/surge protection
Motor elapsed-time meters
Panel heater

2.3 INSTALLATION

2.3.1 Control panel shall be installed in accordance with manufacturer's recommendations, including but not limited to the following:

2.3.1.1 The control panel shall be installed by a licensed electrician. The National Electrical Code and all applicable state and local codes shall be followed when installing this equipment. This includes but is not limited to any provisions for intrinsically safe or explosion-proof wiring. The installation shall be executed in a neat and workmanlike manner.

REV 3/13/15 COPYRIGHT 2015 QED

2.3.1.2 At no time shall any individual tamper with or change any of the wiring in the control panel without the knowledge and consent of QED personnel. The installer shall only land wires on the field terminals provided and install or remove any jumpers as shown and indicated on the control schematics to achieve proper operation. Any changes made to the panel wiring other than those just mentioned or those approved by QED personnel, in writing, will result in the voiding of any warranty associated with the control panel or any of the connected equipment.

SECTION 0401
ENGINEERING SPECIFICATION: PROCESS SENSORS (AIR STRIPPER SYSTEM)

PART 1— GENERAL

1.1 SCOPE

1.1.1 The manufacturer shall furnish process sensors for use in an air stripper system.

1.2 PROCESS DESCRIPTION

1.2.1 Differential pressure switches, gauges, liquid level sensors, liquid flow sensors, and air flow sensors are installed at appropriate points in the air stripper process and linked to a control panel to provide system monitoring capabilities and input for automatic control.

1.3 SUBMITTALS

1.3.1 Manufacturer shall submit the following with the bid:

1.3.1.1 Product data for selected models, including operating ranges, materials, electrical specifications, and warranty coverage. See attached Data Sheet for full specifications.

PART 2 — PRODUCTS

2.1 GENERAL

2.1.1 Equipment shall be supplied by QED Environmental Systems, Inc. and represented by _____ or pre-approved equivalent.

2.1.2 Design and performance of all process sensors shall meet requirements listed in this specification and on the attached Data Sheet.

2.2 EQUIPMENT DESIGN REQUIREMENTS

2.2.1 A sump differential pressure gauge shall be provided as standard equipment to monitor air stripper performance and indicate when cleaning is necessary due to fouling of stripper tray orifices. It shall meet the following specifications:

REV 010122 Copyright 2001 QED

2.2.1.1 Gauge shall be diaphragm-actuated dial type, 4 3/4” O.D., with white dial, black graduations, and pointer zero adjustment. Case shall be die cut aluminum with anti-corrosion coating and break-resistant, clear plastic face. Gauge shall operate with an accuracy of plus or minus 2% of full scale over a temperature range of 20° to 140° F. See Data Sheet for working pressure range and other specifications

2.2.2 A sump sight gauge shall be provided as standard equipment, to meet the following specifications:

2.2.2.1 Gauge shall be constructed of clear plastic tube connected to the sump water drain to allow continuous visual sump water level monitoring. See Data Sheet for specifications.

2.2.3 Sump high level switch and discharge pump on/off switch shall be available separately or together as an air stripper system option. (Note: sump high level switch is highly recommended to prevent stripper overflow and blower damage in the event of a drain or discharge pump malfunction.) They shall meet the following specifications:

2.2.3.1 These switches shall be UL and CSA listed, capable of operating with an adjustable liquid level differential, from a minimum of plus or minus 12” or greater. Design shall prevent false tripping due to turbulence. PVC jacketing shall provide a resistance to chemical attack. Mercury switches shall not be used. See Data Sheet for full specifications.

2.2.4 Sump low pressure and high pressure switches shall be available as air stripper system options. (Note: low pressure switch is highly recommended to provide process system shutdown in the event of blower or gasket failure.) They shall meet the following specifications:

2.2.4.1 These switches shall be diaphragm operated, explosion-proof differential pressure switches, UL and CSA listed, approved for use in Class I Groups C and D, Class II Groups E, F and G, and Class III hazardous atmospheres. See Data Sheet for full specifications.

2.2.5 An air flow indicator shall be available as a system option, to meet the following specifications:

2.2.5.1 Air flow sensor shall be a Pitot Tube type. Design shall meet AMCA and ASHRAE codes and require no calibration. Construction shall be of type 304 stainless steel.

 Copyright 2001 QED

2.2.5.2 Air flow gauge shall be a differential pressure gauge, diaphragm-actuated dial type, 4-3/4” O.D., with white dial, black graduations, and pointer zero adjustment. Case shall be die cut aluminum with anti-corrosion coating and break-resistant, clear plastic face. Gauge shall operate with an accuracy of plus or minus 2% of full range over a temperature range of 20° to 140° F. See Data Sheet for working pressure range and other specifications.

2.2.6 A liquid flow meter shall be available as a system option. Liquid flow meter shall be either an in-line electronic meter with digital readout or a mechanical nutating disc meter, to meet the following specifications:

2.2.6.1 Electronic meter shall sense the rotation of an internal turbine and convert it into flow measurements via an on-board microprocessor. It must be capable of accuracy to within plus or minus 1.5%. Flow shall be displayed on a 6-digit LCD panel, with operation accessed via two buttons. See Data Sheet for specifications.

2.2.6.2 A nutating disc meter shall measure flow via positive displacement; it must be accurate to within plus or minus 1.5% over full range, with an extended 50:1 flow range. Housing shall be of bronze, with only three moving parts to simplify maintenance. See Data Sheet for full specifications.

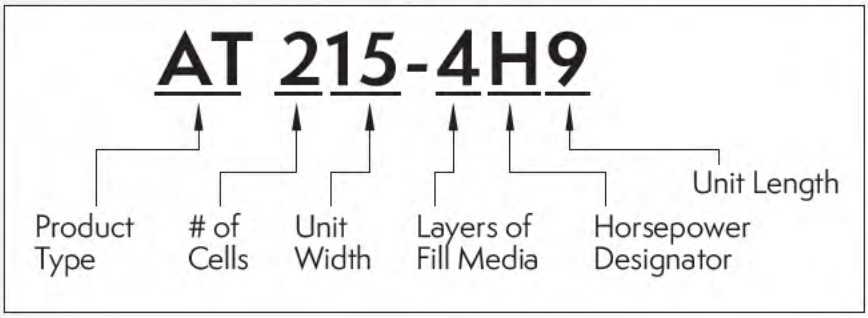
Nomenclature



Product Type
AT – Indicates an Advanced Technology (AT) tower

# of Cells
Determined by the number of inlet connections, can be 1, 2, 3, or 4

Unit Width
The total width of the unit in feet, all cells included. The value is rounded to the next whole number.

Layers of Fill Media
Determined by the number of 1 foot tall fill layers. Can be 2, 3, 4 or 5.

Horsepower Designator
Determined by the horsepower per fan motor. Available from E = 2 HP to R = 100 HP.

Unit Length
The total length of the unit in feet, all cells included. The value is rounded to the next whole number.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

SLSF Addition		130	130	130			1' 6"	1' 6"	

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

SLSF Addition		520	520	260			1' 6"	1' 6"	

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height includes fan guard which ships factory mounted.

SLSF Addition		700	700	700			1' 9-1/2"	1' 9-1/2"	

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

NOTES: (1) An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
(2) Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
(3) Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
(4) Nominal Tonnage is based on 3 gpm per ton at 95 degree entering water temperature, 85 degree leaving water temperature, and 78 degree wet-bulb temperature.
(5) This box size is available in a dual fan/cell configuration.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.
5. This box size is available in a dual fan/cell configuration.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.

✧ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

* Model available with gear drive only. Super Low Sound Fan is not available on this unit.

SLSF Addition		9,600	9,600	2,400			1' 3-1/2"	1' 3-1/2"	

NOTES:
1. An adequately sized bleed line must be installed in the cooling tower system to prevent buildup of impurities in the recirculated water.
2. Do not use catalog drawings for certified prints. Dimensions and weights are subject to change.
3. Adequate spacing must be allowed for access to the cooling tower. Refer to EVAPCO's Equipment Layout Manual.
4. Nominal Tonnage is based on 3 gpm per ton at 95° F entering water temperature, 85° F leaving water temperature, and 78° F wet-bulb temperature.
5. This box size is available in a single fan/cell configuration.

◇ Outlet connection extends beyond bottom flange.
✦ Heaviest section is upper section.
† Height does not include fan guard, which ships loose for field installation.

Drain Down Volume for Remote Sump Applications

The following chart provides the maximum drain down volume allowable per AT box size. Use this chart when sizing indoor or outdoor remote sumps tanks. Remote sump applications are commonly used whenever a cooling tower is idle during sub-freezing weather to protect the water in the basin from freezing or for large multi-tower industrial applications. Either application allows the circulating water to gravity drain into a remote sump tank indoors or a large, outdoor concrete basin located underneath the cooling tower.

The water volume provided is the cooling tower portion of the remote sump tank only. The tank should allow for drain down water from external piping and pump suction coverage.

Optional Equipment: **Electric Basin Heaters**

Electric immersion heaters can be added to the basin of your Advanced Technology series cooling tower. They are sized to maintain a +40° F (4.5° C) pan water temperature with the fans and system pumps off. A thermostat and low-water protection device cycle the heater on when required and prevent the heater elements from energizing unless they are completely submerged. All components are protected by rugged, weatherproof enclosures for outdoor use.

Low Sound Fan – 4-7 dB(A) Reduction

Ideal for sound-sensitive applications, EVAPCO's low sound fan features a wide chord blade and a unique soft-connect blade-to-hub design that is compatible with variable speed drives. Since the blades are not rigidly connected to the fan hub, no vertical vibration forces are transmitted to the unit structure. This reduces sound pressure levels by 4 to 7 dB(A), depending on specific unit selection and measurement location.

The fan is a high efficiency axial propeller and is CTI certified on Advanced Technology (AT) series cooling towers. It has a thermal performance derate of 3.5%. Consult your EVAPCO representative for actual thermal performance.

NOTES:

Models Listed Above.

1. These are suggested arrangements for preliminary layout purposes. Consult your EVAPCO representative for factory certified steel support drawings.
2. The recommended support for the AT Cooling Tower is structural I-beams located under the outer flanges and running the entire length of the unit. The unit should be elevated to allow access underneath the unit and to the roof below. Mounting holes, 3/4" in diameter, are located in the bottom flanges of the pan to provide for bolting to the structural steel.
3. Beams should be sized in accordance with accepted structural practices. Maximum deflection of beam under unit to be 1/360 of the unit length, not to exceed 1/2".
4. For these models where two support beams are required, deflection may be calculated by using 55% of the operating weight as a uniform load on each beam.
5. Beams should be level before setting the unit in place. Do not level the unit by shimming between it and the I-beams.
6. Support beams and Anchor bolts are to be furnished by others.
7. Dimensions, weights and data are subject to change without notice. Refer to the factory certified drawings for exact dimensions.
8. For alternate layout arrangements please consult the factory. *NOTE: OPTIONAL BOTTOM CONNECTIONS WILL REQUIRE THE UNIT TO BE ELEVATED TO ALLOW FOR PIPING.*

NOTES: Models Listed Above.

1. These are suggested arrangements for preliminary layout purposes. Consult your EVAPCO representative for factory certified steel support drawings.
2. The recommended support for the AT Cooling Tower is structural I-beams located under the outer flanges and running the entire length of the unit. The unit should be elevated to allow access underneath the unit and to the roof below. Mounting holes, 3/4" in diameter are located in the bottom flanges of the pan to provide for bolting to the structural steel.
3. Beams should be sized in accordance with accepted structural practices. Maximum deflection of beam under unit to be 1/360 of the unit length, not to exceed 1/2".
4. For these models only where three support beams are required, deflection may be calculated using 56% of the operating weight on the CENTER BEAM and 22% on each OUTBOARD beam.
5. Beams should be level before setting the unit in place. Do not level the unit by shimming between it and the I-beams.
6. Support beams and Anchor bolts are to be furnished by others.
7. Dimensions, weights and data are subject to change without notice. Refer to the factory certified drawings for exact dimensions.
8. For alternate layout arrangements please consult the factory. ***NOTE:*** *OPTIONAL BOTTOM CONNECTIONS WILL REQUIRE THE UNIT TO BE ELEVATED TO ALLOW FOR PIPING.*

NOTES:

Models Listed Above.

1. These are suggested arrangements for preliminary layout purposes. Consult your EVAPCO representative for factory certified steel support drawings.
2. The recommended support for the AT Cooling Tower is structural I-beams located under the outer flanges and running the entire length of the unit. The unit should be elevated to allow access underneath the unit and to the roof below. Mounting holes, 3/4" in diameter are located in the bottom flanges of the pan to provide for bolting to the structural steel.
3. Beams should be sized in accordance with accepted structural practices. Maximum deflection of beam under unit to be 1/360 of the unit length, not to exceed 1/2".
4. For these models only where four or five support beams are required, deflection may be calculated using 56% of the operating weight on the CENTER BEAMS and 22% on each OUTBOARD beam.
5. Beams should be level before setting the unit in place. Do not level the unit by shimming between it and the I-beams.
6. Support beams and Anchor bolts are to be furnished by others.
7. Dimensions, weights and data are subject to change without notice. Refer to the factory certified drawings for exact dimensions.
8. For alternate layout arrangements please consult the factory. ***NOTE: OPTIONAL BOTTOM CONNECTIONS WILL REQUIRE THE UNIT TO BE ELEVATED TO ALLOW FOR PIPING.***

Applications

Design
EVAPCO cooling towers are of heavy-duty construction and designed for long trouble-free operation. Proper equipment selection, installation, and maintenance are necessary to ensure full unit performance while maximizing the equipment's service life. Some of the major considerations in the application of a tower are presented below. For additional information, please contact the factory.

Piping
Cooling tower piping should be designed and installed in accordance with generally accepted engineering practices. All piping should be anchored by properly designed hangers and supports with allowance made for possible expansion and contraction. No external loads should be placed upon cooling tower connections, nor should any of the piping supports be anchored to the unit framework.

The piping connection locations shown on the drawings included in this catalog and on the website are standard locations that can be changed. If the piping connection locations shown do not meet the needs of a particular project, contact the factory to determine a viable solution.

Air Circulation
In reviewing the system design and unit location, it is important that enough fresh air is provided to enable proper unit performance. The best location is on an unobstructed roof top or at ground level away from walls and other barriers. Care must be taken when locating towers in wells or enclosures or next to high walls. The potential for recirculation of the hot, moist discharge air back into the unit intake exists. Recirculation raises the wet-bulb temperature of the entering air, causing the leaving water temperature to rise above the design conditions. For these cases, the overall unit height should be raised so it is even with the adjacent wall, reducing the chance of recirculation. This can be done by raising the entire unit or adding a discharge hood. For additional information, see the EVAPCO Equipment Layout Manual. Engineering assistance is also available from the factory to identify potential recirculation problems and recommend solutions, such as reorienting multi-cell units.

Design Flexibility and Assistance
The large number of EVAPCO AT cooling towers makes it easy to find a model to meet your design and layout needs. If there is an application for which the standard catalog product line does not work, EVAPCO will make a cooling tower that will fit your requirement. Consult your local EVAPCO representative or the factory for assistance with applications, layout, accessories or other design needs.

Water Treatment
Proper water treatment is an essential part of the maintenance required for all evaporative cooling equipment. A well-designed and consistently implemented water treatment program will help to ensure efficient system operation while maximizing the equipment's service life. A qualified water treatment company should design a site-specific water treatment protocol based on equipment (including all metallurgies in the cooling system), location, makeup water quality, and usage.

Without proper water treatment, the equipment can be susceptible to scale buildup on its heat exchange surfaces, biological growth in the recirculating water and corrosion of its components. Your site-specific water treatment protocol should include procedures for routine operation, startup after a shutdown period, and system layup, if applicable.

Passivation Period
If the equipment includes any galvanized components, the initial commissioning and passivation period is a critical time for maximizing the service life of galvanized equipment. EVAPCO recommends that a site-specific water treatment protocol, which includes a passivation procedure that details the desired water chemistry and visual inspections during the first six to twelve weeks of operation, be used. During this passivation period, recirculating water pH should be maintained above 7.0 and below 8.0 at all times.

Recirculating Water System
The cooling in a tower is accomplished by the evaporation of a portion of the recirculated spray water. As this water evaporates, it leaves behind mineral content and impurities. Therefore, it is important to bleed off an amount of water proportional to that which is evaporated to prevent the buildup of impurities. If this is not done, the mineral content and/or the corrosive nature of the water will continue to increase. This can ultimately result in heavy scaling or a corrosive condition.

Bleed or Blowdown
Evaporative cooling equipment requires a bleed or blowdown line to remove concentrated water from the system. The mineral concentration is monitored by measuring the conductivity of the water. EVAPCO recommends an automated conductivity controller to maximize the water efficiency of your system. Based on recommendations from your water treatment supplier, the conductivity controller should open and close a bleed valve to maintain the conductivity of the recirculating water.

Control of Biological Contaminants
Evaporative cooling equipment should be inspected regularly to ensure good microbiological control. Inspections should include both monitoring of microbial populations via culturing techniques and visual inspections for evidence of biofouling. Poor microbiological control can result in a loss of heat transfer efficiency, increased corrosion potential, and an increased risk of pathogens, such as those that can cause risk to health. If excessive microbiological contamination is detected, a more aggressive mechanical cleaning and/or water treatment program should be undertaken.

Sample Mechanical Specification

SECTION 23 65 00 COOLING TOWERS

Below specification applies for a base AT unit with no options or accessories selected. For a copy of a dynamic specification, please contact your local EVAPCO sales representative for access to EVAPCO's **SPECTRUM** selection software.

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes factory assembled and tested, open circuit mechanical induced draft vertical discharge cooling towers.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, pressure drop, performance curves with selected points indicated, furnished specialties, and accessories.

B. Shop Drawings: Complete set of manufacturer's prints of equipment assemblies, control panels, sections and elevations, and unit isolation. Include the following:

1. Assembled unit dimensions.

2. Weight and load distribution.

3. Required clearances for maintenance and operation.

4. Sizes and locations of piping and wiring connections.

5. Wiring Diagrams: For power, signal, and control wiring. Differentiate between manufacturer installed and field installed wiring.

C. Operation and Maintenance Data: Each unit to include operation and maintenance manual.

1.4 QUALITY ASSURANCE

A. Verification of Performance:

1. The thermal performance shall be certified by the Cooling Technology Institute in accordance with CTI Certification Standard STD-201. Lacking such certification, a field acceptance test shall be conducted within the warranty period in accordance with CTI Acceptance Test Code ATC-105, by a Certified CTI Thermal Testing Agency.

2. Unit Sound Performance ratings shall be tested according to CTI ATC-128 standard. Sound ratings shall not exceed specified ratings.

B. Unit shall meet or exceed energy efficiency per ASHRAE 90.1

1.5 WARRANTY

A. Submit a written warranty executed by the manufacturer, agreeing to repair or replace components of the unit that fail in materials and workmanship within the specified warranty period.

1. The Entire Unit shall have a comprehensive one (1) year warranty against defects in materials and workmanship from startup, not to exceed eighteen (18) month from shipment of the unit.

2. Fan Motor/Drive System: Warranty Period shall be Five (5) years from date of unit shipment from Factory (fan motor(s), fan(s), bearings, mechanical support, sheaves, bushings and belt(s)).

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide cooling towers manufactured by one of the following:

1. EVAPCO Model AT _____

2. Approved Substitute

2.2 THERMAL PERFORMANCE

A. Each unit shall be capable to cool _____ GPM of water entering at _____° F leaving at _____° F at a design wet bulb of _____° F.

2.3 IBC COMPLIANCE

A. The unit structure shall be designed, analyzed, and constructed in accordance with the latest edition of International Building Code (IBC) for: IP = 1.0, SDS = 1.34; z/h = 0, P = 119 psf.

2.4 COMPONENTS

A. Description: Factory assembled and tested, induced draft counter flow cooling tower complete with fan, fill, louvers, accessories and rigging supports

B. Materials of Construction

1. All cold water basin components including vertical supports, air inlet louver frames and panels up to rigging seam shall be constructed of heavy gauge mill hot-dip galvanized steel.

2. Upper Casing, channels and angle supports shall be constructed of heavy gauge mill hot-dip galvanized steel. Fan cowl and guard shall be constructed of galvanized steel. All galvanized steel shall be coated with a minimum of 2.35 ounces of zinc per square foot of area (G-235 Hot-Dip Galvanized Steel designation). During fabrication, all galvanized steel panel edges shall be coated with a 95% pure zinc-rich compound.

C. Fan(s):

1. Fan(s) shall be high efficiency axial propeller type with aluminum wide chord blade construction. Each fan shall be dynamically balanced and installed in a closely fitted cowl with venturi air inlet for maximum fan efficiency.

D. Drift Eliminators

1. Drift eliminators shall be constructed entirely of Polyvinyl Chloride (PVC) in easily handled sections. Design shall incorporate three changes in air direction and limit the water carryover to a maximum of 0.001% of the recirculating water rate.

E. Water Distribution System

1. Spray nozzles shall be precision molded ABS, large orifice nozzles utilizing fluidic technology for superior water distribution over the fill media. Nozzles shall be designed to minimize water distribution system maintenance. Spray header and branches shall be Schedule 40 Polyvinyl Chloride (PVC) for corrosion resistance with a steel connection to attach external piping.

F. Heat Transfer Media

1. Fill media shall be constructed of Polyvinyl Chloride (PVC) of cross-fluted design and suitable for inlet water temperatures up to 130° F. The bonded block fill shall be bottom supported and suitable as an internal working platform. Fill shall be self-extinguishing, have a flame spread of 5 under A.S.T.M. designation E-84-81a, and shall be resistant to rot, decay, and biological attack.

G. Air Inlet Louvers

1. The air inlet louver screens shall be constructed from UV inhibited polyvinyl chloride (PVC) and incorporate a framed interlocking design that allows for easy removal of louver screens for access to the entire basin area for maintenance. The louver screens shall have a minimum of two changes in air direction and shall be of a non-planar design to prevent splash-out and block direct sunlight and debris from entering the basin.

H. Makeup Float Valve Assembly

1. Makeup float assembly shall be a mechanical brass valve with an adjustable plastic float.

I. Pan Strainer

1. Pan Strainer(s) shall be all Type 304 Stainless Steel construction with large area removable perforated screens.

2.5 MOTORS AND DRIVES

A. General requirements for motors are specified in Division 23 Section "Motors"

B. Fan Motor

1. Fan motor(s) shall be totally enclosed, ball bearing type electric motor(s) suitable for moist air service. Motor(s) are Premium Efficient, Class F insulated, 1.15 service factor design. Inverter rated per NEMA MG1 Part 31.4.4.2 and suitable for variable torque applications and constant torque speed range with properly sized and adjusted variable frequency drives.

2. Fan motor(s) shall include strip-type space heaters with separate leads brought to the motor conduit box.

C. Fan Drive

1. The fan drive shall be multi-groove, solid back V-belt type with QD tapered bushings designed for 150% of the motor nameplate power. The belt material shall be neoprene reinforced with polyester cord and specifically designed for evaporative equipment service. Fan sheave shall be aluminum alloy construction. Belt adjustment shall be accomplished from the exterior of the unit.

D. Fan Shaft

1. Fan shaft shall be solid, ground and polished steel. Exposed surface shall be coated with rust preventative.

E. Fan Shaft Bearings

1. Fan Shaft Bearings shall be heavy-duty, self-aligning ball type bearings with extended lubrication lines to grease fittings located on access door frame. Bearings shall be designed for a minimum L_{10} life of 100,000 hours.

2.6 MAINTENANCE ACCESS

A. Fan Section

1. Access door shall be hinged and located in the fan section for fan drive and water distribution system access.

B. Basin Section

1. Framed removable louver panels shall be on all four (4) sides of the unit for pan and sump access.

C. Internal Working Platform

1. Internal working platform shall provide easy access to the fans, belts, motors, sheaves, bearings, all mechanical equipment and complete water distribution system. The fill shall be an acceptable means of accessing these components.

D. Louver Access Door

1. Hinged access door in louver shall be provided.

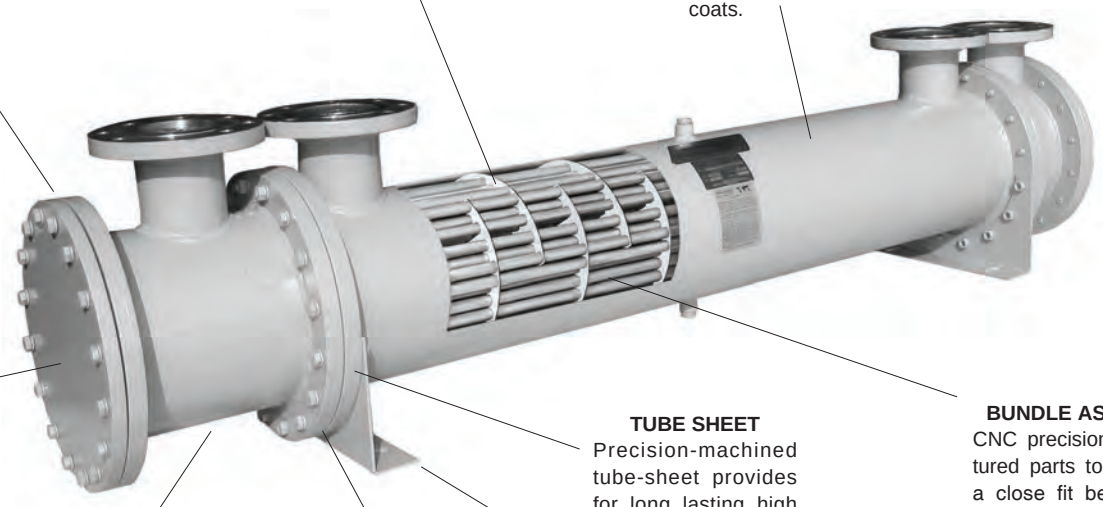
CS 2400 - CS 4800 Series *overview*



BAFFLES
CNC manufactured baffles to provide maximum turbulence and heat transfer with a minimum fluid pressure drop.

FINISH
Gray semigloss enamel suitable for outdoor service. Can be used as a base for additional coats.

FULL FACE GASKET
Full-face composite gasket.

REMOVABLE CHANNEL COVER
For easy access to tubes for cleaning without removing the channel.

TUBE SHEET
Precision-machined tube-sheet provides for long lasting high strength service.

BUNDLE ASSEMBLY
CNC precision manufactured parts to guarantee a close fit between the baffles, tubes, and shell. Clearances are minimized to provide for maximum heat transfer.

FABRICATED CHANNEL
Provides fluid into tubes with minimum restriction. One, two, or four pass interchangeability.

TUBE JOINT
Roller expanded tube joint to tube-sheet.

STEP 1: Calculate the heat load

The heat load in BTU/HR or (Q) can be derived by using several methods. To simplify things, we will consider general specifications for hydraulic system oils and other fluids that are commonly used with shell & tube heat exchangers.

Terms					
GPM	=	Gallons Per Minute	Kw	=	Kilowatt (watts x 1000)
CN	=	Constant Number for a given fluid	T_{in}	=	Hot fluid entering temperature in °F
△T	=	Temperature differential across the potential	T_{out}	=	Hot fluid exiting temperature in °F
PSI	=	Pounds per Square Inch (pressure) of the operating side of the system	t_{in}	=	Cold fluid temperature entering in °F
MHP	=	Horsepower of the electric motor driving the hydraulic pump	t_{out}	=	Cold fluid temperature exiting in °F
			Q	=	BTU / HR

For example purposes, a hydraulic system has a total input 1200 HP (894Kw) electric motor installed coupled to a pump that produces a flow of 600 GPM @ 3000 PSIG. The temperature differential of the oil entering the pump *vs* exiting the system is about 6.6°F. Even though the return line pressure operates below 200 psi, calculate the system heat load potential (Q) based upon the prime movers (pump) capability, cooling fluid is water @ 80ºF use one of the following equations to accomplish this:

To derive the required heat load (Q) to be removed by the heat exchanger, apply ONE of the following. Note: The calculated heat loads may differ slightly from one formula to the next. This is due to assumptions made when estimating heat removal requirements. The factor *(v)* represents the percentage of the overall input energy to be rejected by the heat exchanger. The *(v)* factor is generally about 30% for most hydraulic systems, however it can range from 20%-70% depending upon the installed system components and heat being generated (ie. servo valves, proportional valves, etc…will increase the percentage required).

Formula	Example
A) Q = GPM x CN x actual △T	A) Q =600 x 210 x 6.6°F = 831,600 BTU/HR
B) Q = [(PSI x GPM) / 1714] x (*v*) x 2545	B) Q =[(3000x600)/1714] x .30 x 2545 = 801,808 BTU/HR
C) Q = MHP x (*v*) x 2545	C) Q =1200 x .30 x 2545 = 916,200 BTU/HR
D) Q = Kw to be removed x 3415	D) Q =894 x .30 x 3415 = 915,909 BTU/HR
E) Q = HP to be removed x 2545	E) Q =300 x 2545 = 736,500 BTU/HR

Constant for a given fluid (CN)

1) Oil ..... CN = 210
2) Water..... CN = 500
3) 50% E. Glycol..... CN = 450

STEP 2: Calculate the Mean Temperature Difference

When calculating the MTD you will be required to choose a liquid flow rate to derive the Cold Side △T. If the water flow is unknown you may need to assume a number based on what is available. As a normal rule of thumb, for oil to water cooling a 2:1 oil to water ratio is used. For applications of water to water or 50 % Ethylene Glycol to water, a 1:1 ratio is common.

	Formula	Example (from step 1,item C)
HOT FLUID Oil	$\triangle T = \frac{Q}{CN \times GPM}$	$\triangle T = \frac{916{,}200\ BTU/hr}{210\ CN \times 600 GPM} = 7.37°F$ = △T Rejected
COLD FLUID Water	$\triangle t = \frac{BTU\ /\ hr}{CN \times GPM}$	$\triangle t = \frac{916{,}200\ BTU/hr}{500\ CN \times 300 GPM} = 3.81°F$ = △t Absorbed

T_{in} =	Hot Fluid entering temperature in degrees F	117.3 °F
T_{out} =	Hot Fluid exiting temperature in degrees F	110.0 °F
t_{in} =	Cold Fluid entering temperature in degrees F	80.0 °F
t_{out} =	Cold Fluid exiting temperature in degrees F	86.1 °F

$$\frac{T_{out} - t_{in}}{T_{in} - t_{out}} = \frac{S[\text{smaller temperature difference}]}{L[\text{larger temperature difference}]} = \left(\frac{S}{L}\right) \qquad \frac{110.0°F - 80.0°F}{117.3°F - 86.1°F} = \frac{30.0°F}{31.2°F} = .962$$

STEP 3: Calculate Log Mean Temperature Difference (LMTD)

To calculate the LMTD please use the following method;
L = Larger temperature difference from step 2.
M = S/L number (LOCATED IN TABLE A). .962 = .980
$LMTD_i$ = L x M

$LMTD_i$ = 31.2 x .980 (FROM TABLE A) = 30.6

To correct the $LMTD_i$ for a multipass heat exchangers calculate **R** & **K** as follows:

Formula	Example
$R = \frac{T_{in} - T_{out}}{t_{out} - t_{in}}$	$R = \frac{117.3°F - 100°F}{86.1°F - 90°F} = \frac{17.3°F}{6.1°F} =$ **{2.82=R}**
$K = \frac{t_{out} - t_{in}}{T_{in} - t_{in}}$	$K = \frac{86.1°F - 80°F}{117.3°F - 80°F} = \frac{6.1°F}{37.3°F} =$ **{.163=K}**

Locate the correction factor CF_B (FROM TABLE B)
$LMTD_c = LMTD_i \times CF_B$
$LMTD_c$ = 30.6 x .997 = **30.5**

STEP 4: Calculate the area required

$$\textbf{Required Area sq.ft.} = \frac{Q\ (BTU\ /\ HR)}{LMTD_c \times U\ (\text{FROM TABLE C})} \qquad \frac{916{,}200}{30.5 \times 100} = \textbf{300.4 sq ft.}$$

CS 2400 - 4800 Series *selection*

STEP 5: Selection

a) From TABLE E choose the correct series size, baffle spacing, and number of passes that best fits your flow rates for both shell and tube side. Note that the tables suggest minimum and maximum information. Try to stay within the 20-80 percent range of the indicated numbers.

Example

Oil Flow Rate = 600 GPM = Series Required from Table E = **2400 Series**
Baffle Spacing from Table E = **18 baffle**
Water Flow Rate = 300 GPM = Passes required in 2000 series = **TP**

b) From TABLE D choose the heat exchanger model size based upon the sq ft. or surface area in the series size that will accommodate your flow rate.

Example

Required Area = 300.4 sq.ft Closest model required based upon sq.ft. & series = **CS-2472-12-6-TP**

If you require a computer generated data sheet for the application, or if the information that you are trying to apply does not match the corresponding information, please contact our engineering services department for further assistance.

Receiving / Installation

a) Inspect unit for any shipping damage before uncrating. Indicate all damages to the trucking firms' delivery person, and mark it on the receiving bill before accepting the freight. Make sure that there is no visible damage to the outside surface of the heat exchanger. The published weight information located in this brochure is approximate. True shipment weights are determined at the time of shipping and may vary. Approximate weight information published herein is for engineering approximation purposes and should not be used for exact shipping weight. Since the warranty is based upon the unit date code located on the model identification tags, removal or manipulation of the identification tags will void the manufacturers warranty.

b) When handling the shell & tube heat exchanger, special care should be taken to avoid dropping the unit since mishandling could cause the heat exchanger to crack and leak externally. Mishandling of the unit is not covered under the manufacturers warranty. All units are shipped with partial wood/corrugated cardboard containers for safe handling.

c) Storage: American Industrial heat exchangers are protected against the elements during shipment. If the heat exchanger cannot be installed and put into operation immediately upon receipt, certain precautions are required to prevent deterioration during storage. The responsibility for integrity of the heat exchanger(s) is assumed by the user. American Industrial will not be responsible for damage, corrosion, or other deterioration of the heat exchanger during transit or storage.
Proper storage practices are important when considering the high costs of repair or replacement, and the possible delays for items which require long lead times for manufacture. The following listed practices are provided solely as a convenience to the user, who shall make their own decision on whether to use all or any of them.

1) Heat exchangers not to be placed in immediate service, require precautionary measures to prevent corrosion or contamination.
2) Heat exchangers made of ferrous materials, may be pressure-tested using compressed air at the factory. Residual oil coating on the inside surfaces of the heat exchanger(s) as a result of flushing does not discount the possibility of internal corrosion. Upon receipt, fill the heat exchanger(s) with the appropriate grade of oil or apply a corrosion preventing inhibitor for storage.
3) Corrosion protection compounds for interior surfaces for long term storage or other applications are applied solely at the request of customers. Upon request, American Industrial can provide a customer approved corrosion preventative if available when included in the original purchase order specifications.
4) Remove all dirt, water, ice, or snow and wipe dry before moving heat exchanger(s) into storage. Heat exchangers are generally shipped empty, open drain plugs to remove any accumulated condensation moisture, then reseal. Accumulation of moisture usually indicates corrosion has already started and remedial action should be taken.
5) Store in a covered, environmentally stable area. The ideal storage environment for heat exchangers is in a dry, low-humidity atmosphere which is sealed to prevent the entry of blowing dust, rain, or snow. Maintain in atmospheric temperatures between 70°F and 105°F (Large temperature swings may cause condensation and moisture to form on steel components, threads, shell, etc...) Use thermometers and humidity indicators and maintain the atmosphere at 40% relative humidity, or lower.

d) Standard Enamel Coating: American Industrial provides its standard products with a normal base coat of oil base air cure enamel paint. The enamel paint is applied as a temporary protective and esthetic coating prior to shipment. While the standard enamel coating is durable, American Industrial does not warranty it as a long-term finish coating. It is strongly suggested that a more durable final coating be applied after installation or prior to long-term storage in a corrosive environment to cover any accidental scratches, enhance esthetics, and further prevent corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

e) Special Coatings: American Industrial offers as customer options, Air-Dry Epoxy, and Heresite (Air-Dry Phenolic) coatings at additional cost. American Industrial offers special coatings upon request, however American Industrial does not warranty coatings to be a permanent solution for any equipment against corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

f) American Industrial recommends that the equipment supplied should be installed by qualified personnel who have solid understanding of system design, pressure and temperature ratings, and piping assembly. Verify the service conditions of the system prior to applying any shell & tube heat exchanger. If the system pressure or temperature does not fall within the parameters on model rating tag located on the heat exchanger, contact our factory prior to installation or operation.

g) Plan the installation to meet the requirements indicated on the piping installation diagram as illustrated above. It is recommended to put the

note: AIHTI reserves the right to make reasonable design changes without notice.
Copyright © 2019 - 2020 American Industrial Heat Transfer, Inc. 355 American Industrial Drive LaCrosse, VA 23950 tel: 434-757-1800 fax: 434-757-1810 email: sales@aihti com

hot fluid to be cooled through the shell side and the cold fluid through the tube side. The indicated port assembly sequence in the diagram maximizes the performance, and minimizes the possibility of thermal shock. In instances where the fluids are required to be reversed, *hot fluid in the tubes and cold fluid in the shell* the heat exchanger will work with reduced performance. Installation may be vertical or horizontal or a combination thereof. However, the installation must allow for complete draining of the heat exchanger regardless of Single Pass, Two Pass, or four pass construction. Complete drainage is important to prevent the heat exchanger from freezing, over-heating of a fluid, or mineral deposit buildup.
For fixed bundle heat exchangers, provide sufficient clearance at one end to allow for the removal or replacement of tubes. On the opposite end, provide enough space to allow removal of the channel cover and complete channel to provide sufficient clearance to permit tube rolling and cleaning. Channel covers can be removed to aid in cleaning the tubes without disassembling channel, plumbing, or mounting hardware. Allow accessible room for scheduled cleaning as needed. Include thermometer wells and pressure gauge pipe ports in piping to and from the heat exchanger located as close to the heat exchanger as possible. For more information please contact American Industrial.

h) It is recommended to use flexible hose wherever possible to reduce vibration and allow slight movement. However, hoses are not required. Hydraulic carrying lines should be sized to handle the appropriate flow and to meet system pressure drop requirements based upon the systems parameters, and not based upon the units supply and return connection size. We recommend that a low cracking pressure direct acting relief valve be installed at the heat exchanger inlet to protect it from pressure spikes by bypassing oil in the event the system experiences a high flow surge. If preventative filtration is used it should be located ahead of the cooler on both shell and tube side to catch any scale or sludge from the system before it enters the cooler. Failure to install filters ahead of the heat exchanger could lead to possible heat exchanger failure due to high pressure if the system filters plug.

i) Standard shell & tube coolers are built with a rolled tube-sheet construction. However, the differential operating temperature between the entering shell side fluid and the entering tube side fluid should not exceed 150°F. If this condition exists, a severe thermal shock could occur leading to product failure and mixing of the fluids. For applications with a differential temperatures of 150°F or more, we recommend using a series with a floating tube-sheet, u-tube, or expansion joint to reduce the potential for the effects of thermal shock.

j) Water requirements vary from location to location. If the source of cooling water is from other than a municipal water supply, it is recommended that a water strainer be installed ahead of the heat exchanger to prevent dirt and debris from entering and clogging the flow passages. If a water modulating valve is used it is recommended to be installed at the inlet to the cooler to regulate the water flow.

k) For steam service, or other related applications, please consult our engineering department for additional information.

Maintenance
a) Inspect the heat exchanger for loosened bolts, connections, rust spots, corrosion, and for internal or external fluid leakage. Any corroded surfaces should be cleaned and recoated with paint.

b) Shell side: In many cases with clean hydraulic system oils it will not be necessary to flush the interior of the shell side of the cooler. In circumstances where the quality of hydraulic fluid is in question, the shell side should be disconnected and flushed on a yearly basis with a clean flushing oil/solvent to remove any sludge that has been deposited. For severe cases where the unit is plugged and cannot be flushed clean with solvent, the heat exchanger should be replaced to maintain the proper cooling performance.

c) Tube side: In many cases it will be necessary to clean the tube side of the heat exchanger due to poor fluid quality, debris, calcium deposits, corrosion, mud, sludge, seaweed, etc.... To clean the tube side, flush with clean water or any good quality commercial cleaner that does not attack the particular material of construction. With straight tube heat exchangers you can use a rod to carefully push any debris out of the tubes.

d) Zinc anodes are normally used to reduce the risk of failure due to electrolysis. Zinc anodes are a sacrificial component designed to wear and dissolve through normal use. Normally, zinc anodes are applied to the water supply side of the heat exchanger. Depending upon the amount of corrosive action, one, two, three, or more anodes can be applied to help further reduce the risk of failure. American Industrial Heat Transfer, Inc. offers zinc anodes as an option, to be specified and installed at the request our customers. It is the responsibility of the customer to periodically check and verify the condition of the zinc anode and replace it as needed.

Applications vary due to water chemical makeup and quality, material differences, temperature, flow rate, piping arrangements, and machine grounding. For those reasons, zinc anodes do not follow any scheduled factory predetermined maintenance plan moreover they must be checked routinely by the customer, and a maintenance plan developed based upon the actual wear rate.

If substantial wear occurs or zinc dissolves without replacement, premature failure or permanent damage may occur to the heat exchanger. American Industrial does not warranty customer applications. It is the responsibility of the customer to verify and apply the proper system materials of construction and overall system requirements. Failures resulting from properly applied or misapplied use of zinc anode(s) into non-specified or specified applications will be the sole responsibility of the customer.

e) A routine maintenance schedule should be developed and adjusted to meet your systems requirements based upon water quality, etc....Failure to regularly maintain and clean your heat exchanger can result in a reduction in operational performance and life expectancy.

Note: *Since applications can vary substantially, the installation and maintenance information contained in this catalog should be used as a basic guideline. The safe installation, maintenance, and use of any American Industrial Heat Transfer, Inc. heat exchanger are solely the responsibility of the user.*

HPAF SERIES FILTERS

HPAF series filters are designed to treat liquid streams in a wide variety of adsorption applications. The modular design enables the units to easily fit into a wide variety of installations. Standard features include steel construction with epoxy internal coating, efficient internal collector array, forklift skid and lifting eyes.

A wide variety of options and contact medias are available, con-

cincinnati fan

A Company That Stands Behind Its Product

Since the founding of **Cincinnati Fan** in 1956, the company's mission has been to provide quality products at competitive prices, backed by dependable service.

This mission is carried out by specializing in the market for industrial air handling products up to 125 HP. But specialization does not mean the product line is small. **Cincinnati Fan** offers a wide variety of standard and customized products, production flexibility, and customer responsiveness.

Cincinnati Fan has over 170 experienced sales engineers across the U.S. and Canada ready to serve your air handling needs.

Cincinnati Fan can provide:

- Technical evaluation for correct performance conditions.
- Review of air stream and ambient conditions that require special attention.
- Selection of proper components to meet required design specifications.
- Selection of proper accessories.

Cincinnati Fan operates in a modern facility specifically designed for world class manufacturing enabling us to build standard products to order, including accessories, and ship within 10-15 working days.

With support like this, you can be sure your **Cincinnati Fan** product will be well-built and will provide maximum dependability and longevity.

Visit us at www.cincinnatifan.com for more information.

SPECIFICATIONS FOR HP SERIES II BLOWERS

Radial bladed pressure blowers shall be Cincinnati Fan HP, Series II, Model _____, Arrangement _____ Capacity: _____ CFM, _____ Static Pressure at standard conditions. Operating conditions: _____°F, _____Ft. Altitude.

Wheels shall be dynamically balanced to assure smooth operation. Fan motor and bearing vibration levels shall not exceed 1.5 mils displacement at 3500 RPM. Shafts shall be turned, ground and polished steel (or stainless steel). All fan shafts shall receive a rust preventive coating prior to shipment. All fans shall be test run at factory before shipping.

All construction gauges shall be as shown in Cincinnati Fan's HP, Series II catalog, page 16. The blower housing shall be continuously welded and supported to minimize pulsation at all conditions. Fan bearings shall be grease-lubricated, heavy-duty, self-aligning ball bearings mounted in cast iron pillow blocks. V-belt drives shall be selected for a minimum of 1.3 times nominal horsepower.

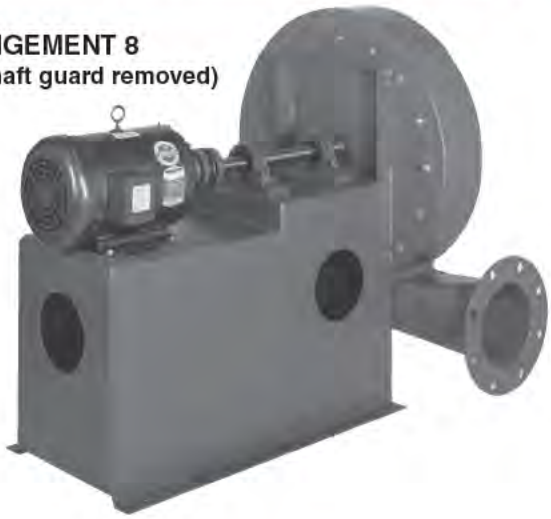
All parts in contact with airstream shall be standard steel, aluminum or stainless steel as specified.

Before painting, steel parts shall be cleaned by detergent wash, phosphatized and painted with oven cured gray enamel.

The following accessories shall be included: (See page 5 for optional accessories).

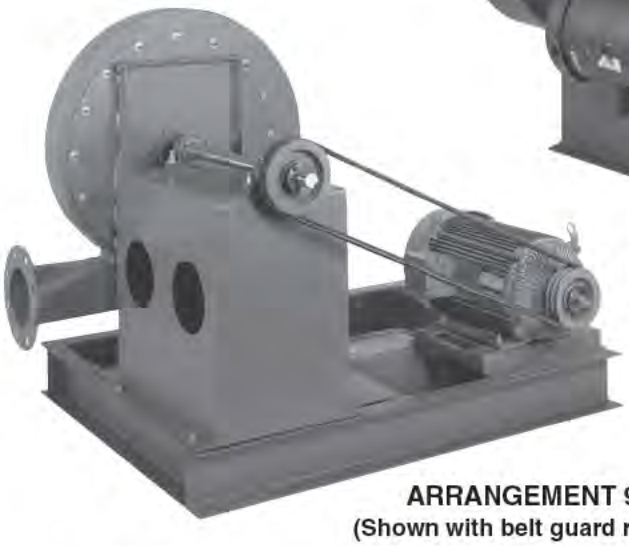
SIX STANDARD ARRANGEMENTS

ARRANGEMENT 1



ARRANGEMENT 8
(Shown with shaft guard removed)

ARRANGEMENT 9
(Shown with optional shaft guard)



ARRANGEMENT 9CB
(Shown with belt guard removed)

ARRANGEMENT 4
(Arrangement 4HM not shown)

ARRANGEMENT 1 (V-BELT DRIVE)

- Motor not mounted on bearing base.
- Wheel mounted on fan shaft with two pillow block bearings.
- Maximum temperature of standard design: 300°F; high temperature design: 750°F.

ARRANGEMENT 8 (DIRECT DRIVE)

- Motor mounted on motor base extending beyond the bearing base.
- Wheel mounted on fan shaft with two pillow block bearings.
- Maximum temperature of standard design: 300°F; high temperature design: 750°F.
- For dimensions, contact your local Cincinnati Fan sales office.

ARRANGEMENT 9 (V-BELT DRIVE)

- Motor mounted on an adjustable slide base on the side of the bearing base.
- Wheel mounted on fan shaft with two pillow block bearings.
- Maximum temperature of standard design: 300°F; high temperature design: 750°F.

ARRANGEMENT 9CB (V-BELT DRIVE)

- Same as Arrangement 9 except motor and fan are mounted on a common channel base.
- Maximum temperature of standard design: 300°F; high temperature design: 750°F.

ARRANGEMENT 4 & 4HM (DIRECT DRIVE)

- Motor mounted on motor base.
- Wheel mounted on motor shaft.
- Maximum temperature of standard design: 200°F; high temperature design: 400°F.
- For arrangement 4HM, see page 16.

HP SERIES II FEATURES

A) Wheels are fabricated of heavy-gauge, high-strength steel to assure long lasting, efficient operation. (Not shown.)

B) Turned, ground and polished shafting assures smooth operation. A rust preventative coating is applied prior to shipment.

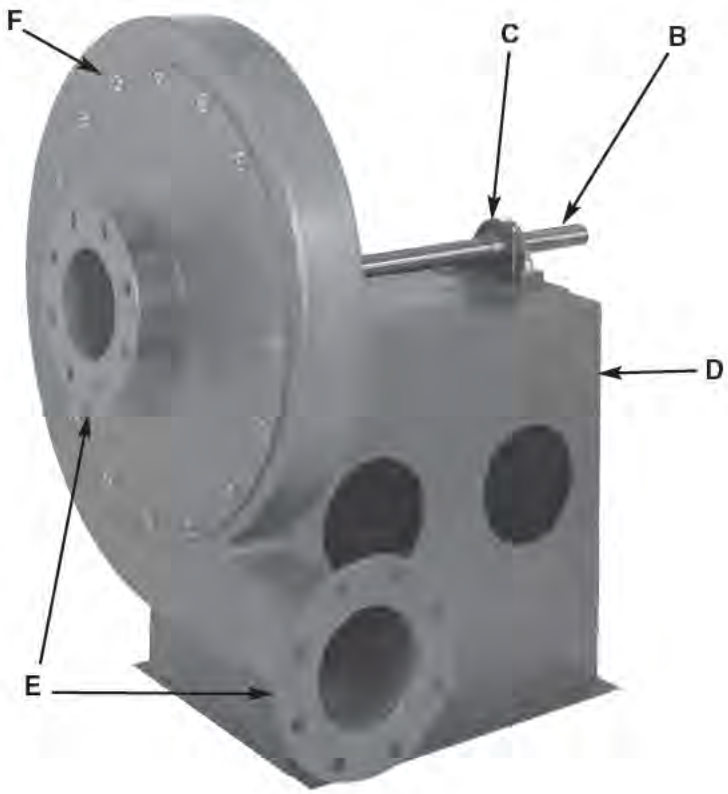
C) Heavy-duty, self-aligning ball bearings in relubricatable cast-iron pillow blocks. Bearings are selected for optimal performance depending on fan size.

D) Bearing base is heavy steel construction with internal supports to maximize rigidity and assure long equipment life. Arrangement #1 fans can be converted to Arrangement #9 with the addition of the motor slide base.

E) Flanged inlet and outlet standard. Drilled per ANSI 125 pound and ASA 150 pound specifications with holes straddling centers. See ★ note on page 18.

F) Reversible housing provides increased configuration flexibility. Removable side plates allow the wheel to be removed from the motor or inlet side of the housing. Housings are rotatable in 45 degree increments.

G) Teflon shaft seal is standard. Ceramic seal is used for applications above 400°F. (Not shown.)



SPARK-RESISTANT CONSTRUCTION

Type A: All parts in contact with airstream are of nonferrous material. **Maximum temperature 200°F.** Consult factory.

Type B: Aluminum wheel and aluminum rubbing ring for motor shaft or fan shaft. **Maximum temperature 200°F.**

Type C: Consists of an aluminum plate on drive side of the fan and aluminum inlet plate assembly. **Maximum temperature 750°F.**

⚠ WARNING

The use of aluminum or aluminum alloys in the presence of steel which has been allowed to rust requires special consideration. Research by the U.S. Bureau of Mines and others has shown that aluminum impellers rubbing on rusty steel may cause high intensity sparking.

The use of the above construction in no way implies a guarantee of safety for any level of spark resistance. Spark resistant construction also does not protect against ignition of explosive gases caused by catastrophic failure or from any airstream material that may be present in a system.

OPTIONAL ACCESSORIES

Belt Guard
Belt guard standard on Arrangement 9 and 9CB only. **Painted safety yellow.**

Drain Connection
3/4" pipe coupling welded to lowest point of housing. Not required on BH discharge position.

Inspection Door
Inspection door available on all sizes except 4A, 4C and 6C. Rubber gasket standard to 250°F. Silicone gasket standard at temperatures of 250°F. to 750°F.

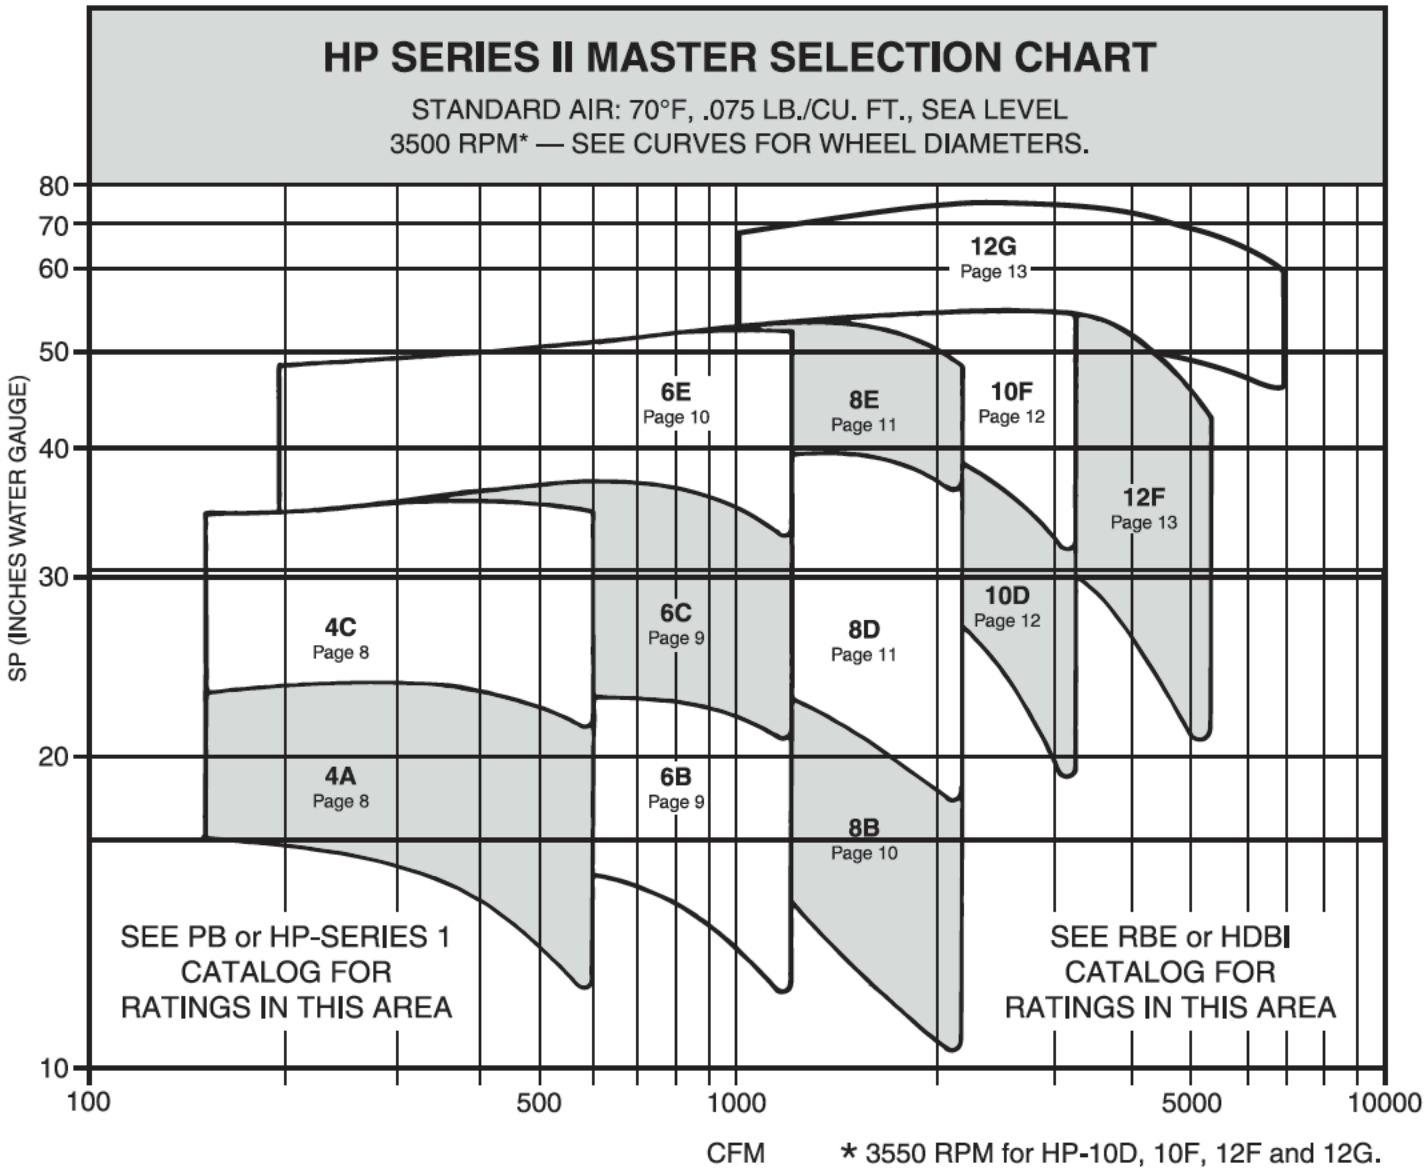
Inlet Bell
With OSHA type guard.

Outlet Guard
OSHA type.

Shaft and/or Heat Slinger Guard
Guard available on Arrangement 1, 9 and 9CB. Standard on Arrangement 8. Covers bearings and shaft between fan housing and belt guard. Bearings relubricatable through guard. **Painted safety yellow.**

⚠ DANGER

All fans & blowers shown have rotating parts and pinch points. Severe personal injury can result if operated without guards. Stay away from rotating equipment unless it is disconnected or locked out from its power source. Read operating instructions.



HOW TO USE THE MASTER SELECTION CHART

The above chart is intended to guide you to the correct fan for a desired performance rating. This chart was prepared for standard air (70° F., 29.92" Hg barometric pressure and .075 lbs. per cubic foot density.)

All fans were tested with an inlet bell. All performance curves in this catalog are for standard air, at the fan inlet, entering the inlet (whether belled or ducted) with static pressure measured at the discharge.

Corrections are required for temperature and/or altitude and rarefication. See page 7 for correction factors.

Rarefication: When air is pulled into a blower inlet (negative pressure) the air molecules are "stretched out", or rarefied, and become less dense than at the blower discharge where the air is compressed.

Catalog ratings may be used directly, without correction, for static pressures defined at the fan discharge. For static pressures defined at the fan inlet (i.e., negative pressures), a correction is typically only made for inlet suction pressures greater than 15" W.G. See page 7 for details.

HIGH TEMPERATURE CONSTRUCTION

Arrangements 4 and 4 HM

Up to 200°F. **Standard fan construction.**

201°- 400°F. Standard fan with shaft seal, heat slinger, slinger guard and external hub on wheel.

Arrangements 1, 8, 9 and 9CB

Up to 300°F. **Standard fan construction.**

301°- 400°F. Standard fan with heat slinger and shaft/slinger guard.

401°- 600°F. Standard fan with heat slinger, shaft/slinger guard and high temperature shaft seal, gasketing and paint.

601°- 750°F. Standard fan with heat slinger, shaft/slinger guard, 316SS fan shaft and high temperature shaft seal, gasketing and paint.

TEMPERATURE RANGE	MAXIMUM RPM REDUCTION FACTOR†
Up to 175°F.	0%
176°-200°	2%
201°-300°	4%
301°-400°	7%
401°-500°	11%
501°-600°	15%
601°-700°	20%
701°-750°	30%

† Steel wheels only.

Fan performance tables are developed using standard air which is 70°F., 29.92" barometric pressure and .075 lbs. per cubic foot. Density changes resulting from temperature or barometric pressure variations (such as high altitudes) must be corrected to standard conditions before selecting a fan based on standard performance data.

Temperature and/or altitude conversion factors are used in making corrections to standard conditions.

EXAMPLE:

Select an HP Series II fan to deliver 4800 CFM at 30" SP at 160°F., and 7000' altitude.

STEP 1. From the table, conversion factor is 1.53.

STEP 2. Correct static pressure is:
1.53 x 30" SP = 45.9" SP at standard conditions.

STEP 3. Check HP, Series II catalog for 4800 CFM at 45.9" SP. We select a HP12F with a 26" diameter wheel at 3500 RPM and 56 BHP.

STEP 4. Correct the BHP for the lighter air:
56 ÷ 1.53 = 36.6 BHP. A 40 HP motor will suffice at 160° F., and 7000' but not at standard conditions. Special motor insulation may be required above 3500 feet altitude. Consult factory.

SUCTION PRESSURE CORRECTIONS

The two tables at the right give corrected static pressures for suction pressure (rarefication). These corrected static pressures are for standard air (70°F., 29.92" Hg barometric pressure and .075 lbs. per cubic foot density) at the blower inlet.

If the inlet air temperature and/or altitude are different, make those corrections as shown above and then correct for rarefication.

Suction Pressure in Inches W.G.	Corrected Static Pressure
16	16.7
18	18.8
20	21.0
22	23.3
24	25.5

***Min. HP:** This is the suggested minimum motor horsepower for Arrangement 4 fans with a nominal 3500 RPM motor speed. In a few situations motors suitable for the fan *operating point* BHP may not have sufficient torque to start the fan as *quickly* as desired. Therefore, use a motor horsepower at least as large as those listed in the tables to the left. The suggested motor horsepower values are based on typical Baldor three phase motors. Motor starting torques from other vendors will vary. These tables do not apply to Arrangement 4 fans with 1750 RPM and 2850 RPM motors, and any belt driven fans. A smaller horsepower motor may be acceptable for some of these applications.

DIMENSIONS and SPECIFICATIONS

NOTE: The table below contains blower housing dimensions common to all arrangements on pages 15, 17 and 18.

	444TS			30					51 1/2	47 1/2		36	

* COMPLETE MODEL NUMBER INCLUDES WHEEL DIAMETER. Fan housings are reversible and rotatable in 45° increments.

① Discharge flange not available with Downblast (DB) discharge position on models HP-8B, HP-10D, HP-12F and HP-12G.

② For AMCA Type "C" spark resistant construction, add 1/8 inch to dimensions "G", "BB" and "CC".

③ Inlet side support plate is only included on model HP-12G.

④ On some models, motor may extend past end of motor base.

Inclined Plate Clarifiers

LP & LP-Q MODELS

- Lower installed cost
- Easily installed indoors
- Minimal start-up/restart time
- Lower maintenance costs
- Occupies less floor space
- Minimal field labor required to install

The Hydro Quip Inclined Plate Clarifiers are designed and manufactured to provide for the precipitation and separation of suspended solids. Our design employs the use of a series of plates inclined at an angle of 45° or 55°. This specialized design allows the unit to perform all of the functions of a conventional solids contact clarifier at a fraction of the space and cost.

LP Model: separation of suspended solids from water
LP-Q Model: separation of suspended solids and trace amounts of oil in water

INLET COMPARTMENT

The inlet compartment receives the raw water from the process. After entering through the non-clogging inlet nozzle, the water in the LP model is dispersed evenly through the chamber.

In the LP-Q model, the water enters the quiescent zone. This area disperses the energy and evenly distributes the flow. A skimmer is provided to decant the oil to a separate tank.

SEPARATION CHAMBER

The raw water from the inlet chamber passes down under the plate pack skirt and moves upwards toward the plate pack. As the water moves upwards, the suspended particles have their upward velocity interrupted by the inclined plates. These particles drop down and slide down the inclined plate and join larger previously settled particles in the sludge hopper. Individual plates are easily installed and removed.

SLUDGE CHAMBER

The sludge chamber collects the solids as they fall. The sludge hopper is sloped at a minimum 45° angle to concentrate the sludge and avoid bridging.

CLEAN WATER CHAMBER

The clarified water exits the top of the plates and flows into the effluent trough. From this point the clarified effluent flows by gravity and exits the unit through the effluent nozzle.

PERFORMANCE

- Excellent separation of suspended solids
- Up to 1200 sq ft of projected plate surface area
- Effective separation of hard to settle solids
- Ability to produce up to 3% – 5% concentrated sludge

TECHNICAL FEATURES

- Individual removable polypropylene or stainless steel plates
- Stainless steel or coated carbon steel tanks
- Complete shop assembly
- Adjustable effluent weir
- Oil skimming connections
- Inspection hatch/ window
- Sample ports

OPTIONAL EQUIPMENT/ FEATURES

The inclined plate clarifier is available with a number of different options such as:

- Access Platform and Ladder (or Stairs)
- Cover
- Flash Mixer Chamber with Mixer
- Flocculation Tank with Slow Speed Mixer
- Instrumentation / Controls
- Chemical Feed Equipment
- Sludge Handling and Dewatering
- Concrete Tank Designs

FILTRATION SPECIFICATIONS

Filter: Model 8 Basket Strainers and Bag Filters

Model 8 strainer/filter housings are made in 2 sizes and 2 pressure ratings, and can serve as basket strainers (for particle retention down to 74 micron size) or as bag filters (for particle retention down to 1 micron size).

FEATURES

- Low pressure drops
- Permanently piped housings
- Covers are o-ring sealed
- Carbon steel, 304 or 316 stainless steel construction
- All housings are electropolished to resist adhesion of dirt and scale
- Adjustable-height legs
- Large-area, heavy-duty baskets
- O-ring seals: Buna N, EPR, Fluoroelastomer, PTFE
- Two pressure ratings: 150 and 300
- Pipe sizes 2-inch to 4-inch, NPT or flanged
- Two basket depths: 15 or 30 inches (nominal)
- ASME code stamp available

OPTIONS

- Duplex Units Available
- Special Alloys
- Sanitary Construction
- Different Outlet Connections
- Higher Pressure Ratings
- Extra-Length Legs
- Heat Jacketing
- Liquid Displacers for Easier Servicing
- NSF 61 Certified

OPERATION

Unfiltered liquid enters the housing above the bag or basket and flows through. Solids are contained inside the bag or basket, where they are easily removed when the unit is serviced. A basket bail is pushed down by the closed cover to hold the basket against a positive stop in the housing. A radial seal prevents bypass of unfiltered liquid.

©2019 Rosedale Products Inc. • 3730 West Liberty Road - Ann Arbor, MI 48103 • Phone: 734.665.8201 • Fax: 734.665.2214 • RosedaleProducts.com

FILTRATION SPECIFICATIONS

Filter: Model 8 Basket Strainers and Bag Filters

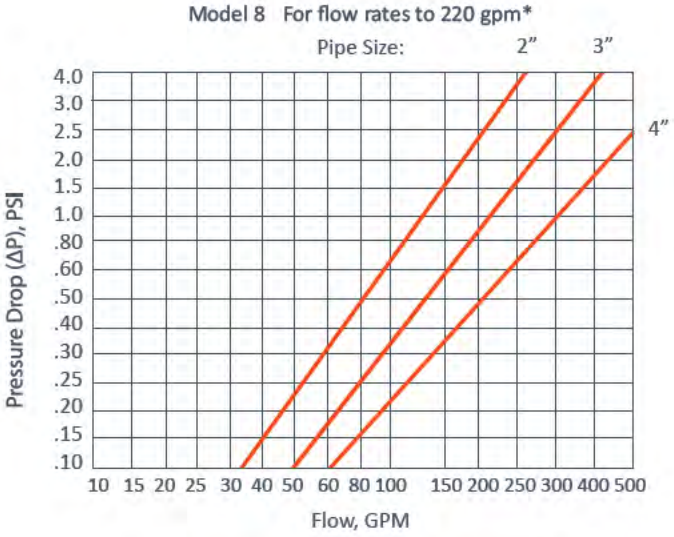
PRESSURE DROP DATA

Basket strainers and bag filters are usually selected so that the pressure drop does not exceed 2 psi when they are clean. Higher pressure drops may be tolerated when contaminant loading is low. Bag change-out should occur at 15 psid.

The pressure drop data is determined by the steps below:

FOLLOW THESE EASY STEPS:

1. Using the desired pipe size and approximate flow rate, determine the pressure drop from the appropriate graph.
2. Multiply the pressure drop obtained in step 1 by the viscosity correction factor found in the accompanying table. This is the adjusted pressure drop for all baskets, without filter bags.
3. Add the pressure drop for the bag filter housing.



*Based on housing only. Fluid viscosity, bag filter used, and expected dirt loading should be considered when sizing a filter.

Eyenut covers with filter bag or basket.

Filter bags are specified and sold separately.

KAESER COMPRESSORS®

Rotary Screw Compressors

SM Series

With the world-renowned SIGMA PROFILE

Flow rate 0.39 to 1.64 m³/min, Pressure 5.5 to 15 bar

www.kaeser.com

SM Series

Long-term savings

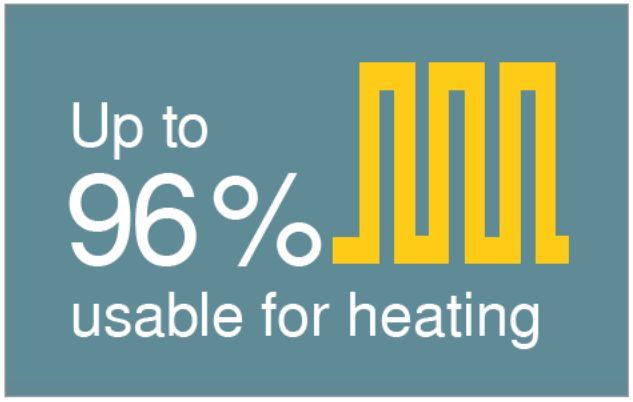
Today's users expect maximum availability and efficiency from their compressors, regardless of size. SM series rotary screw compressors meet these key expectations and more. Not only do they deliver more compressed air for less energy, but they also combine ease of use and maintenance-friendliness with exceptional versatility and environmentally responsible design.

SMart with SIGMA 06

The latest generation SM series rotary screw compressors feature the new SIGMA 06 airend with further-refined SIGMA PROFILE rotors for higher intake volumes and even greater efficiency. The result? Up to 13 percent lower power consumption and up to 10 percent higher flow rate.

Energy-saving performance

The efficiency of a machine depends on the total costs incurred throughout the equipment's entire service life. With compressors, energy costs account for the lion's share of total expenditure. KAESER therefore designed its SM series compressors with optimum energy efficiency in mind. Refinements to the energy-saving SIGMA PROFILE airend rotors contribute significantly to the increased performance of these versatile compressors, whilst Super Premium Efficiency IE4 motors (Premium Efficiency IE3 motors for the SM 10 and SM 16), a SIGMA CONTROL 2 internal controller, low airend speeds, reduced internal pressure losses and a unique dual-flow fan cooling system all combine to push the boundaries of efficiency even further.



Optimised design

The new SM models all share logical and user-friendly design throughout. For example, the left-hand side panel can be removed in a few simple steps to allow excellent visibility of the system's intelligently laid out components. Needless to say, the SM series was designed to ensure best possible access to all service points. When closed, the sound-absorbing compressor enclosure keeps operational sound levels to a minimum, thereby ensuring a pleasantly quiet work environment. In addition, the enclosure features four inlet openings for separate airflow cooling of the compressor, motor, control cabinet and intake air. Last but not least, SM series compressors are impressively compact, which makes them the perfect choice for applications where space is at a premium.

Modular system concept

SM series compressors are available as standard versions, as versions equipped with an add-on energy-saving refrigeration dryer and as AIRCENTER versions which, in addition to a refrigeration dryer, feature an air receiver installed underneath. KAESER's intelligent modular design principle therefore offers incredible flexibility. The SM 13 model is also available with a frequency converter for infinitely variable flow rate control.

Why choose heat recovery?

In fact, the question should be: Why not? Amazingly, up to 100 % of the (electrical) energy supplied to a compressor is converted into heat. Up to 96 % of this energy can be recovered and reused for heating purposes. This not only reduces primary energy consumption, but also improves the company's overall energy balance.

Quiet, powerful, reliable and durable.

SM Series

Design is in the details

SIGMA PROFILE airend

At the heart of every SM system lies a new, premium-quality airend featuring Kaeser's energy-saving SIGMA PROFILE rotors. With optimised flow characteristics, these rotors play a key role in setting new standards in specific power performance.

SIGMA CONTROL 2

The SIGMA CONTROL 2 ensures efficient control and system monitoring. The large display and RFID reader provide effective communication and maximum security. Multiple interfaces offer exceptional flexibility, whilst the SD card slot makes updates quick and easy.

Tomorrow's technology, available today: IE4 motors

KAESER remains the only compressed air systems provider to equip compressors with Super Premium Efficiency IE4 drive motors as standard (SM 13 models), thereby delivering maximum performance and energy efficiency. SM 10 and SM 16 model compressors are equipped with Premium Efficiency IE3 motors.

Efficient cooling

KAESER's innovative cooling system uses a highly efficient, dual-flow fan and separate airflow channels for cooling the motor, fluid / compressed air aftercooler and control cabinet. This not only achieves optimum cooling performance, low compressed air discharge temperatures and minimal operating sound levels, but also more efficient compression.

SM T (SFC) Series

Also available with refrigeration dryer and variable speed control

SM with energy-saving dryer

The compressed air refrigeration dryer is installed in a separate enclosure in order to shield it from heat radiated by the compressor. The automatic shutdown function further enhances energy-efficient performance.

Variable speed control also available

The use of variable speed control can provide definite advantages for specific applications, which is why the SM 13 is also available with this feature. The frequency converter is integrated into the compressor system's control cabinet (with a separate fan) and is thermally isolated.

Even quieter

The new cooling system provides outstanding cooling performance and enables optimum sound-proofing. Normal conversation can take place right beside the running compressor.

Maintenance-friendly

All maintenance work can be carried out from one side of the unit. The left housing cover is easily removed to allow excellent component accessibility.

Image: SM 13 T

Image: AIRCENTER 13

AIRCENTER

The compact and efficient complete compressed air station

Connect and go

Simply connect the power supply and air distribution network to this compact complete compressed air station and it is ready to operate. No further installation work is necessary.

Durable air receiver

The 270-litre air receiver is specially designed for installation in AIRCENTER systems. All inner and outer surfaces are coated to provide excellent corrosion protection and to ensure long service life.

Service-friendly design

The left-hand housing cover is easily removed to allow excellent accessibility to all service points. Inspection glasses allow convenient inspection of fluid levels, condensate drain and drive belt tension whilst the unit is in operation.

KAESER FILTER for pure air

Thanks to lowest possible differential pressure, original KAESER FILTER products (optional) efficiently ensure compressed air of all purity classes as per ISO 8573-1, whilst allowing rapid and clean replacement of the filter elements. They are available in four different filter grades.

IE4
KAESER
SM 13
SIGMA

Equipment

Complete system

Ready-to-run, fully automatic, super-silenced, vibration damped, all panels powder coated. Suitable for use in ambient temperatures up to +45 °C.

Airend

Genuine KAESER single-stage airend with SIGMA PROFILE rotors and cooling fluid injection for optimised rotor cooling.

Electric motor

Super Premium Efficiency IE4 (Premium Efficiency IE3 in SM 10 / SM 16) motor, quality German manufacture, IP 55.

Fluid and air flow

“Honeycomb” structure air intake filter, pneumatic inlet and venting valves, cooling fluid separator tank with triple separation system, pressure relief valve, minimum pressure / check valve, thermostatic valve and fluid filter within the cooling fluid circuit, fluid / compressed air combination cooler.

Refrigeration dryer (with T version)

Pressure dew point measurement via PT 100 sensor and electronic level-controlled condensate drain with alarm contact as standard. Refrigerant compressor with energy-saving, cycling shutdown feature; linked to operational status of the compressor when inactive. Alternatively, continuous operation can be selected on site.

Electrical components

Ventilated IP 54 control cabinet, automatic star-delta starter, overload relay, control transformer.

SIGMA CONTROL 2

"Traffic light" LED indicators show operational status at a glance; plain text display, over 30 selectable languages, soft-touch keys with icons, fully automated monitoring and control. Selection of Dual, Quadro, Vario and Continuous control modes as standard. Interfaces: Ethernet; additional optional communications modules for: Profibus DP, Modbus, Profinet and Devicenet. SD card slot for data-logging and updates. Reader and web server.

SIGMA AIR MANAGER 4.0

The refined adaptive 3-D^{advanced} Control predictively calculates and compares the various operating options and selects the most efficient one to suit the specific needs of the application.

The SIGMA AIR MANAGER 4.0 constantly adjusts flow rates and compressor energy consumption in response to current compressed air demand. This optimisation is made possible by the integrated industrial PC with multi-core processor, in combination with the adaptive 3-D^{advanced} Control. Furthermore, the SIGMA NETWORK bus converter (SBC) provides a host of possibilities for enabling the system to be individually tailored to meet specific user requirements. The SBC can be equipped with digital and analogue input and output modules, as well as with SIGMA NETWORK ports, in order to enable seamless display of flow rate, pressure dew point, performance or alarm message information.

Amongst other key features, the SIGMA AIR MANAGER 4.0 provides long-term data storage capacity for reporting, controlling and audits, as well as for energy management tasks as per ISO 50001.

Improving a great, trusted and proven product was the challenge. The Legend DSL integrates proven experience with world-class blower design and manufacturing to create a product worthy of the name "Legend."

Quality + Tradition = Trust

- Tradition: 150 years of quality manufacturing with proven results
- Every Legend DSL is manufactured in our ISO 9001 certified facility in Sedalia, Missouri
- Each Legend DSL is individually tested to meet rigorous performance specifications
- Superior and consistent quality can be found in each Legend DSL as a result of:
  - Continual investment in the training of world-class manufacturing personnel
  - Quality inspections throughout the entire manufacturing process
- Requested by leading Original Equipment Manufacturers (OEMs) worldwide for a wide range of applications
- A Legend is at the heart of an ever-expanding variety of air solutions working every minute of every day
- Supported by a worldwide network of experienced and trusted sales and service professionals
- Quiet Series available with reduced noise up to 5 dBA
- The Legend DSL Warranty
  - **30 months** from the date of shipment or
  - **24 months** from the date of installation, whichever occurs first

Experience Proven Results
with the Legend DSL

Legend DSL Provides

– Pressure to 15 psig

– Vacuum to 16" Hg

– Airflow to 950 cfm

– 24/30 Warranty

Innovation

- Refined timing and locking device incorporates frictional keyless shaft gear locking rings
  - Improves blower life with more resistance to slipped timing
  - Allows for easier maintenance
- Spherical roller bearing on drive shaft (4–6" gear diameters only)
  - Provides greater allowance for misaligned drives, and improves longevity

Results

- Drop-in replacement for current Legend products
- Operating temperatures which can be up to 15°F cooler compared to leading competitive brands
- Greater durability with an increased capacity for overhung load by as much as 30%
- Unmatched strength and rigidity from increased mass, which can be up to 37% more than leading competitive brands
- Universal mounting feet allows for easy field conversion

Advanced Engineering Capabilities

Finite Element Analysis (FEA) – thermal analysis

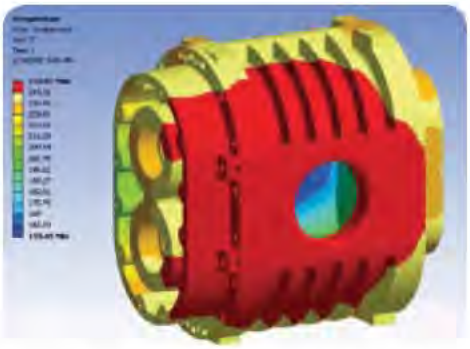

Figure 1 – Previous design was developed without the benefit of FEA thermal analysis.

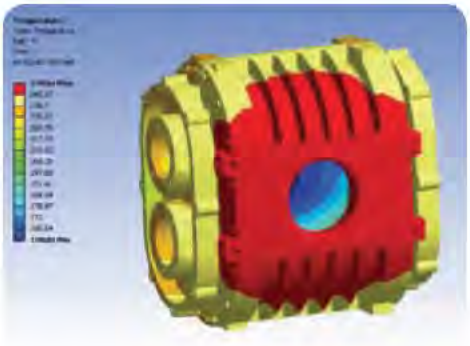

Figure 2 – With FEA thermal analysis, a good design was made great.

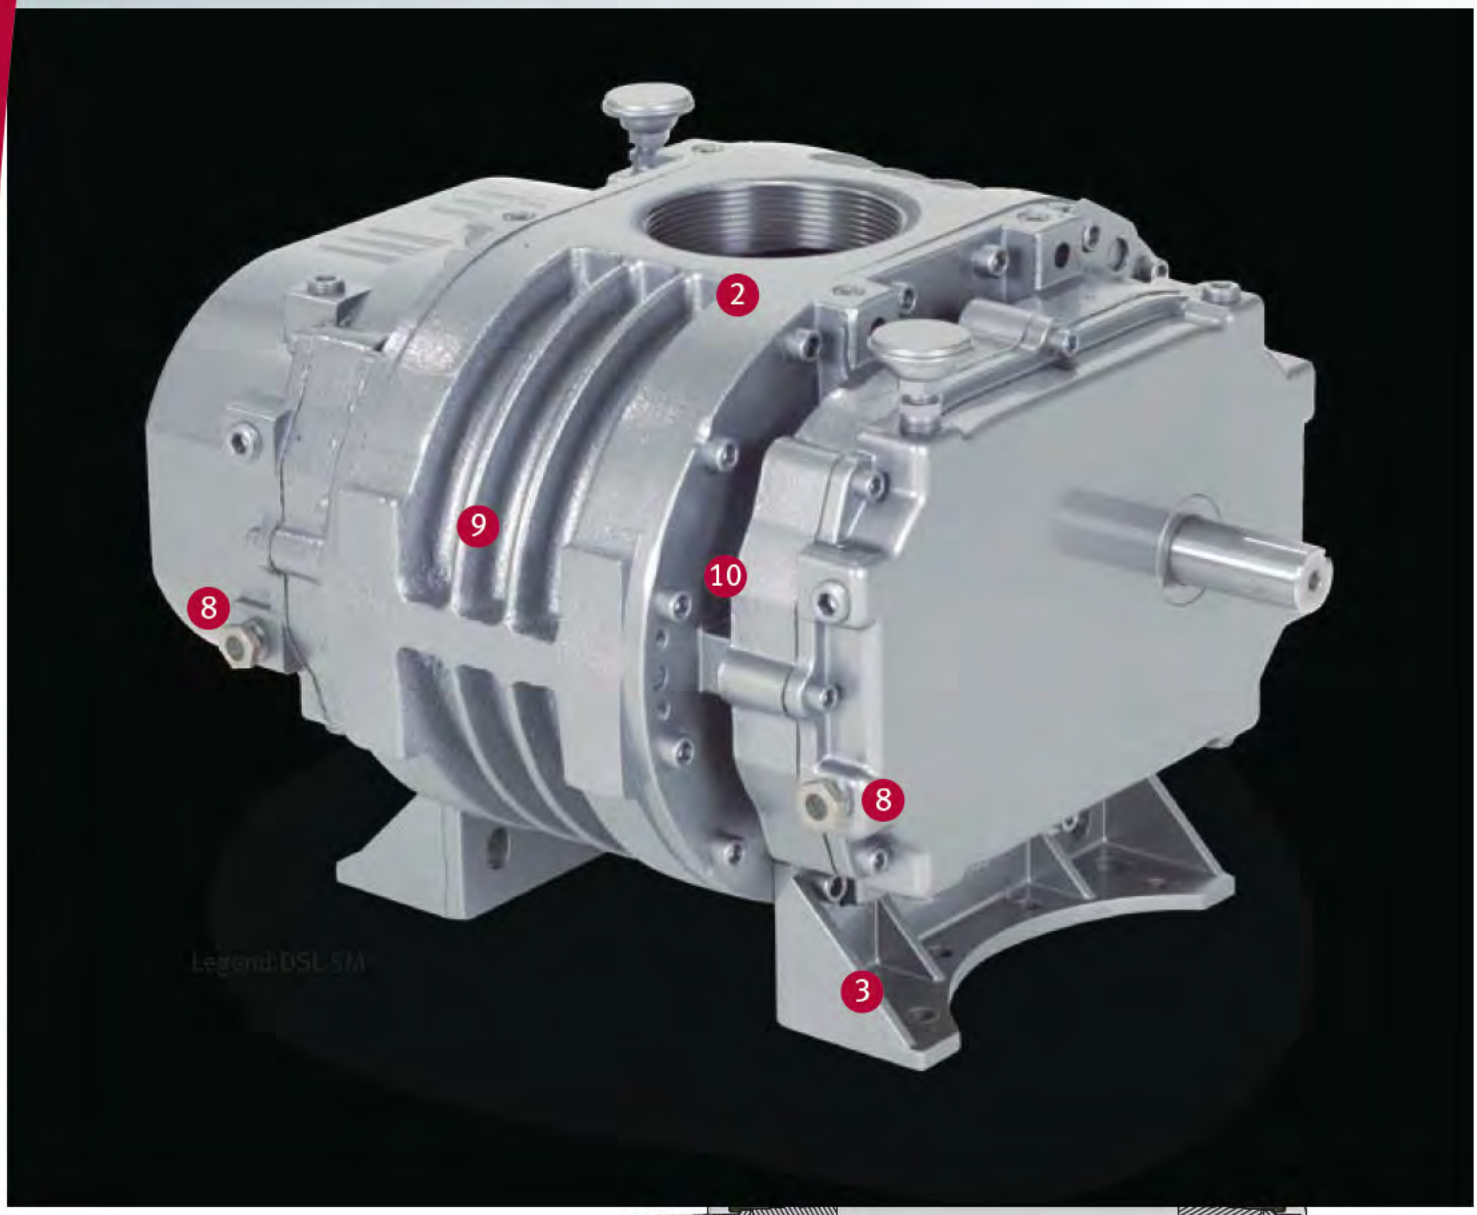
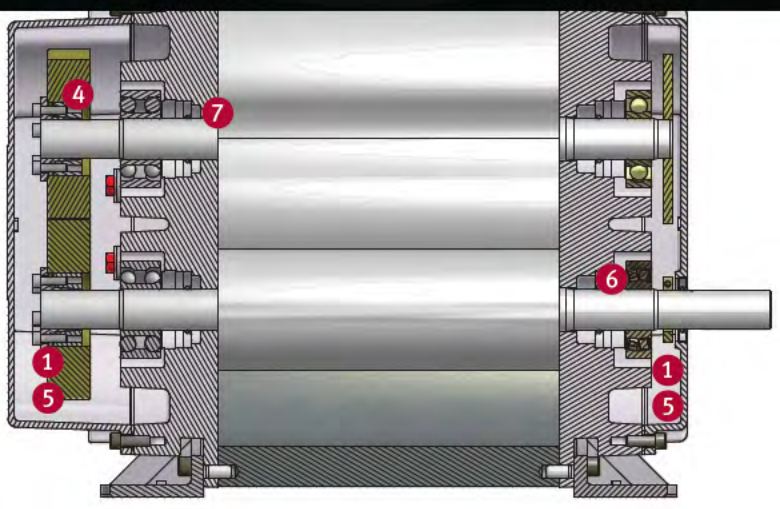
- Innovative bearing housing design with air gaps reduce drive end sump temperatures which can be up to 15°F, extending lubricant, bearing, and blower life

Legendary DSL Design Features & Benefits





1. Dual Splash Lubrication

- Reliable splash lubrication on both gear and drive ends for longer product life
- One-piece slingers are securely clamped on both shafts to ensure efficient lubrication, and allow installation flexibility

2. Single Piece Cylinder Provides Greater Strength & Rigidity

- Heavy-duty reinforced cast iron cylinder retains internal clearance
- DSL design utilizes the existing Legend cylinder and rotors with proven results

3. Universal Feet

- Drop-in replacement for current Legend design
- Reduce inventory and provide installation flexibility
- One set of feet for vertical and horizontal configurations

4. Improved Timing= Improved Reliability

- Grip rings expand against the bore and compress on the shaft for a secure, mechanical shrink fit
- Replaces pinning of timing gears
- Easier and more cost effective to teardown and rebuild

5. Larger Sump Capacities = Cooler Running Bearings

- Sump capacity is increased as much as 30% on drive end and 62% on gear end over leading competition

6. Greater Overhung Load Capacity Increases Blower Life

- Improving overhung load capabilities by as much as 30%
- Belt drive capabilities are independent of blower/ motor orientation for improved packaging options
- Spherical roller drive bearing provides better misalignment capabilities (4–6" gear diameter)
- Cylindrical drive bearing on 3" gear diameter

7. High Temperature Viton® Oil Seals

- Maximize the seal life in continuous, severe-duty applications to provide leak-free operation

8. Site Glasses

- Installed on side of unit and can be readily converted in the field

9–10. Cooler Operating Temperatures Increases Blower Life

- Integral ribs (9) improve heat dissipation and performance
- Engineered air gap (10) to isolate the oil sumps from hot air
- Engineered lubrication channels ensure ample lubrication reaches critical components

Robust Design Improves Performance & Efficiency

- Additional weight provides more rigidity to the blower allowing greater efficiency and tighter clearances
- The Legend DSL weights are greater than leading competitive brands which can be up to 37% heavier

Mechanical Gas Seals

- The Legend DSL design accommodates mechanical gas seals for critical gas applications

Genuine Gardner Denver Parts & Lubricants

- Maintain the Gardner Denver performance advantage and reliability with Genuine GD Replacement Parts available through authorized sales and service representatives
- Protect your Gardner Denver investment with AEON® PD, the only lubricant specially formulated for all blowers in any environment
  - Now available:
    - ›› AEON® PD-XD (eXtreme Duty)
    - ›› Designed specifically for high ambient and high discharge temperature applications
  - Also available:
    - ›› AEON® PD (standard applications)
    - ›› AEON® PD-FG (Food Grade)

Quality Promise

- Gardner Denver industrial blowers are manufactured under rigid ISO 9001 quality standards
- All models are thoroughly tested to meet the highest performance standards for unequaled service life under the most severe operating conditions

Gardner Denver®

ENERGY STAR PARTNER

ISO 9001 CERTIFIED QUALITY SYSTEM

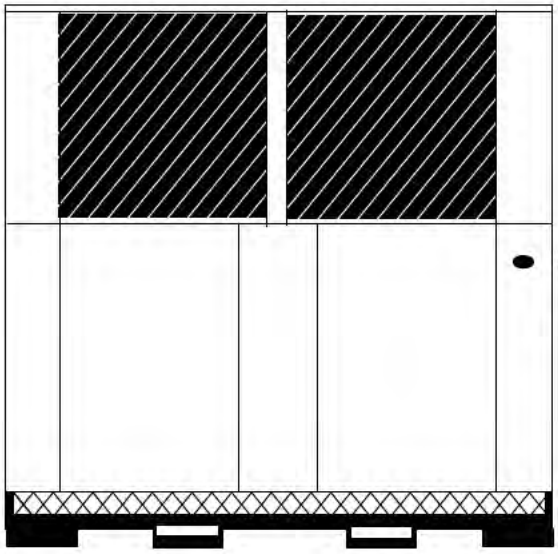
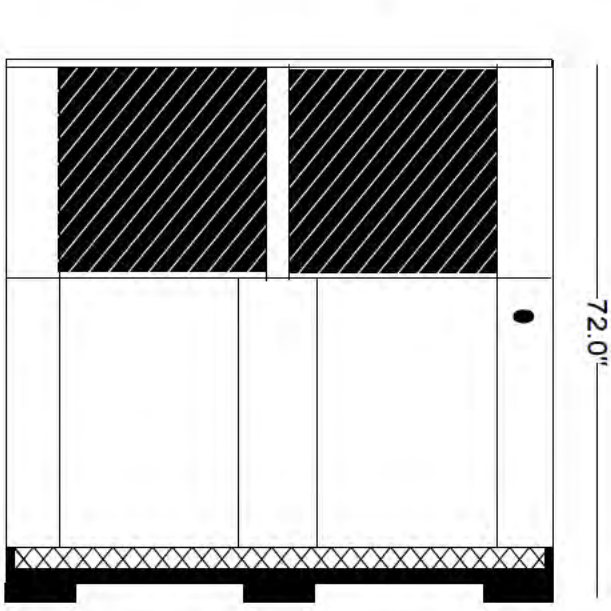
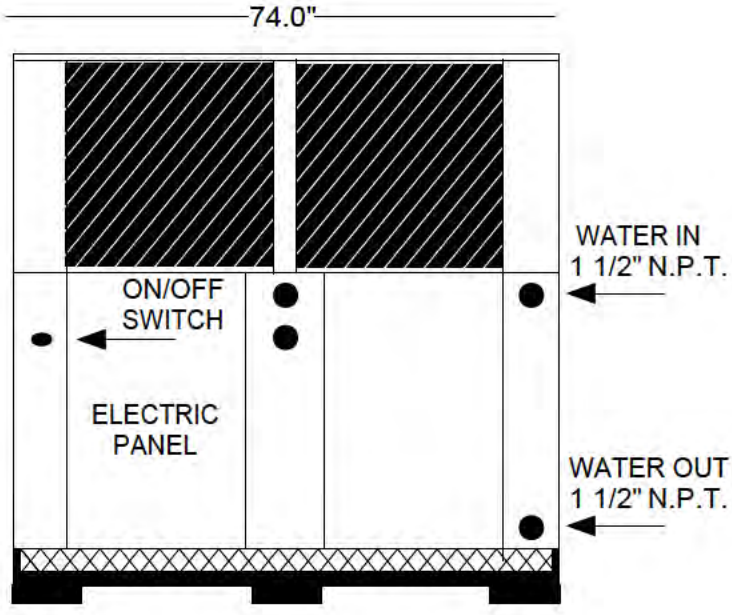
MODEL: RTS-1604 SPEC







SPECIFICATIONS:

- 192,000 BTU/HR heat removal - 95F degree ambient, 45F degree water out.
- Electrical: 460 / 60HZ / 3 PH 24 volt electrical panel.
- Run Load: 43.95 Amps.
- Minimum Circuit Ampacity: 46; Maximum Circuit Ampacity: 83.
- ETL/CSA Laboratory Approved: ETL # 63122 & CAN/CSA NO. 236
- (2) 40 gallon, 16 gage, 304 stainless steel closed evaporator tank with coil inside.
- 1.5 HP water pump: 30 - 40 GPM, 35 - 45 PSI.
- Low ambient start-up package (standard).
- R422D Refrigerant.
- Analog water temperature and pressure gauges.
- Air-cooled condenser.
- Cabinet: 18 and 20 gage Phos coat galvanized steel finished with polyester powder coat.
- Base frame: 1/8 - inch angle & channel iron.
- Multi-compressor design: (4) 4 ton Copeland Hermetic (5 - year warranty).
- Independent multi-compressor operation for staged loads.
- Approximate crated weight: 2400 LBS.
- Physical dimensions: 74" wide, 74" long, and 72" tall.

SRCS SERIES

Single Pass

Two Pass

Straight Tube Removable Bundle / Liquid Cooled

HEAT EXCHANGERS

- Computer generated data sheet available for any application
- Removable straight-tube bundle
- Brass stationary and floating tube sheets.
- Brass packing and retaining rings.
- Dual Viton O-ring packing seals.
- Removable channel covers for access to tubes without disturbing existing plumbing.
- As an option, available in ASME code and certified
- Operating pressure, 150 PSI tubes, 250 PSI shell.
- Operating temperature 400°F
- Can be customized to fit any applications.

note: AIHTI reserves the right to make reasonable design changes without notice.

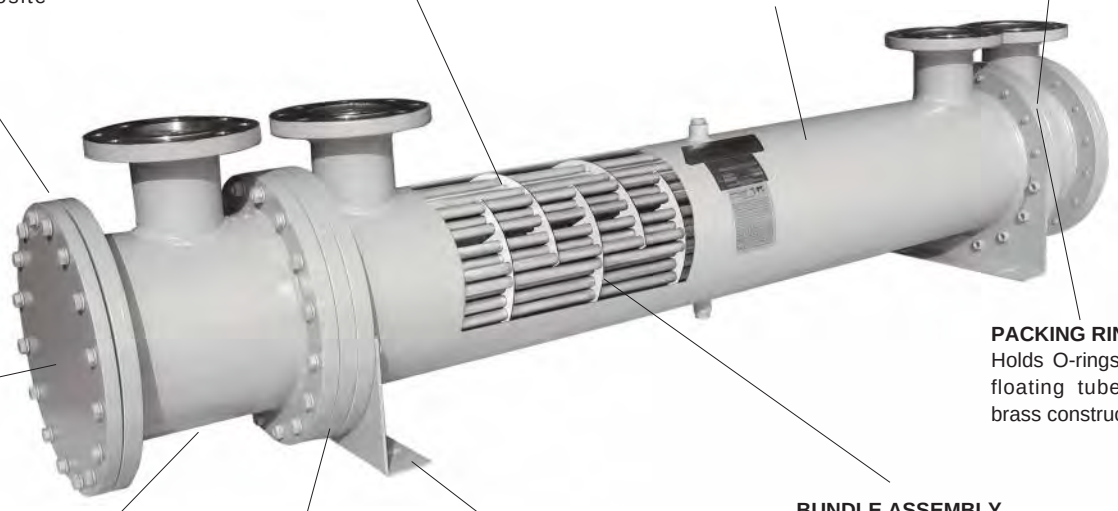
SRCS Series *overview*



BAFFLES
CNC manufactured baffles to provide maximum turbulence and heat transfer with a minimum fluid pressure drop.

FINISH
Gray semigloss enamel. Can be used as a base for additional coats.

RETAINING RING
Holds packing O-rings in place, brass construction.

FULL FACE GASKET
Full-face composite gasket.

REMOVABLE CHANNEL COVER
For easy access to tubes for cleaning without removing the channel.

PACKING RING
Holds O-rings against floating tube sheet, brass construction.

BUNDLE ASSEMBLY
CNC precision manufactured parts to guarantee a close fit between the baffles, tubes, and shell. Clearances are minimized to provide for maximum heat transfer.

STEEL FOOT BRACKET

CHANNEL
Provides fluid into tubes with minimum restriction. One or Two Pass interchangeability.

STATIONARY TUBE SHEET
Roller expanded tube joint to tube-sheet made of brass construction.

STEP 1: Calculate the heat load

The heat load in BTU/HR or (Q) can be derived by using several methods. To simplify things, we will consider general specifications for hydraulic system oils and other fluids that are commonly used with shell & tube heat exchangers.

Terms					
GPM	=	Gallons Per Minute	Kw	=	Kilowatt (watts x 1000)
CN	=	Constant Number for a given fluid	T_{in}	=	Hot fluid entering temperature in °F
△T	=	Temperature differential across the potential	T_{out}	=	Hot fluid exiting temperature in °F
PSI	=	Pounds per Square Inch (pressure) of the operating side of the system	t_{in}	=	Cold fluid temperature entering in °F
MHP	=	Horsepower of the electric motor driving the hydraulic pump	t_{out}	=	Cold fluid temperature exiting in °F
			Q	=	BTU / HR

For example purposes, a hydraulic system has a total input 1200 HP (894Kw) electric motor installed coupled to a pump that produces a flow of 600 GPM @ 3000 PSIG. The temperature differential of the oil entering the pump *vs* exiting the system is about 6.6°F. Even though return line pressure operates below 200 psi, calculate the system heat load potential (Q) based upon the prime movers (pump) capability, cooling fluid is water @ 80ºF use one of the following equations to accomplish this:

To derive the required heat load (Q) to be removed by the heat exchanger, apply ONE of the following. Note: The calculated heat loads may differ slightly from one formula to the next. This is due to assumptions made when estimating heat removal requirements. The factor *(v)* represents the percentage of the overall input energy to be rejected by the heat exchanger. The *(v)* factor is generally about 30% for most hydraulic systems, however it can range from 20%-70% depending upon the installed system components and heat being generated (ie. servo valves, proportional valves, etc…will increase the percentage required).

Formula	Example
A) Q = GPM x CN x actual △T	A) Q =600 x 210 x 6.6°F = 831,600 BTU/HR
B) Q = [(PSI x GPM) / 1714] x (*v*) x 2545	B) Q =[(3000x600)/1714] x .30 x 2545 = 801,808 BTU/HR
C) Q = MHP x (*v*) x 2545	C) Q =1200 x .30 x 2545 = 916,200 BTU/HR
D) Q = Kw to be removed x 3415	D) Q =894 x .30 x 3415 = 915,909 BTU/HR
E) Q = HP to be removed x 2545	E) Q =300 x 2545 = 736,500 BTU/HR

Constant for a given fluid (CN)

1) Oil ..... CN = 210
2) Water..... CN = 500
3) 50% E. Glycol..... CN = 450

STEP 2: Calculate the Mean Temperature Difference

When calculating the MTD you will be required to choose a liquid flow rate to derive the Cold Side △T. If the water flow is unknown you may need to assume a number based on what is available. As a normal rule of thumb, for oil to water cooling a 2:1 oil to water ratio is used. For applications of water to water or 50 % Ethylene Glycol to water, a 1:1 ratio is common.

	Formula	Example (from step 1,item C)
HOT FLUID Oil	$\triangle T = \frac{Q}{CN \times GPM}$	$\triangle T = \frac{916{,}200\ BTU/hr}{210\ CN \times 600 GPM} = 7.37°F$ = △T Rejected
COLD FLUID Water	$\triangle t = \frac{BTU\ /\ hr}{CN \times GPM}$	$\triangle t = \frac{916{,}200\ BTU/hr}{500\ CN \times 300 GPM} = 3.81°F$ = △t Absorbed

T_{in}	=	Hot Fluid entering temperature in degrees F	117.3 °F
T_{out}	=	Hot Fluid exiting temperature in degrees F	110.0 °F
t_{in}	=	Cold Fluid entering temperature in degrees F	80.0 °F
t_{out}	=	Cold Fluid exiting temperature in degrees F	86.1 °F

$$\frac{T_{out} - t_{in}}{T_{in} - t_{out}} = \frac{S[\text{smaller temperature difference}]}{L\ [\text{larger temperature difference}]} = \left(\frac{S}{L}\right) \qquad \frac{110.0°F - 80.0°F}{117.3°F - 86.1°F} = \frac{30.0°F}{31.2°F} = .962$$

STEP 3: Calculate Log Mean Temperature Difference (LMTD)

To calculate the LMTD please use the following method;
L = Larger temperature difference from step 2.
M = S/L number (LOCATED IN TABLE A). .962 = .980
$LMTD_i$ = L x M

$LMTD_i$ = 31.2 x .980 (FROM TABLE A) = 30.6

To correct the $LMTD_i$ for a multipass heat exchangers calculate **R** & **K** as follows:

Formula	Example
$R = \frac{T_{in} - T_{out}}{t_{out} - t_{in}}$	$R = \frac{117.3°F - 100°F}{86.1°F - 90°F} = \frac{17.3°F}{6.1°F} =$ **{2.82=R}**
$K = \frac{t_{out} - t_{in}}{T_{in} - t_{in}}$	$K = \frac{86.1°F - 80°F}{117.3°F - 80°F} = \frac{6.1°F}{37.3°F} =$ **{.163=K}**

Locate the correction factor CF_B (FROM TABLE B)
$LMTD_c = LMTD_i \times CF_B$
$LMTD_c$ = 30.6 x .997 = **30.5**

STEP 4: Calculate the area required

$$\textbf{Required Area sq.ft.} = \frac{Q\ (BTU / HR)}{LMTD_c \times U\ (\text{FROM TABLE C})} \qquad \frac{916{,}200}{30.5 \times 100} = \textbf{300.4 sq.ft.}$$

note: AIHTI reserves the right to make reasonable design changes without notice.
Copyright © 2019 - 2020 American Industrial Heat Transfer, Inc. 355 American Industrial Drive LaCrosse, VA 23950 tel: 434-757-1800 fax: 434-757-1810 email: sales@aihti.com

SRCS Series *selection*

STEP 5: Selection

a) From TABLE E choose the correct series size, baffle spacing, and number of passes that best fits your flow rates for both shell and tube side. Note that the tables suggest minimum and maximum information. Try to stay within the 20-80 percent range of the indicated numbers.

Example

Oil Flow Rate = 600 GPM = Series Required from Table E = **2400 Series**
Baffle Spacing from Table E = **18 baffle**
Water Flow Rate = 300 GPM = Passes required in 2000 series = **TP**

b) From TABLE D choose the heat exchanger model size based upon the sq.ft. or surface area in the series size that will accommodate your flow rate.

Example

Required Area = 300.4 sq.ft Closest model required based upon sq.ft. & series = **SRCS-2484-18-6-TP**

If you require a computer generated data sheet for the application, or if the information that you are trying to apply does not match the corresponding information, please contact our engineering services department for further assistance.

Receiving / Installation

a) Inspect unit for any shipping damage before uncrating. Indicate all damages to the trucking firms' delivery person, and mark it on the receiving bill before accepting the freight. Make sure that there is no visible damage to the outside surface of the heat exchanger. The published weight information located in this brochure is approximate. True shipment weights are determined at the time of shipping and may vary. Approximate weight information published herein is for engineering approximation purposes and should not be used for exact shipping weight. Since the warranty is based upon the unit date code located on the model identification tags, removal or manipulation of the identification tags will void the manufacturers warranty.

b) When handling the shell & tube heat exchanger, special care should be taken to avoid dropping the unit since mishandling could cause the heat exchanger to crack and leak externally. Mishandling of the unit is not covered under the manufacturers warranty. All units are shipped with partial wood/corrugated cardboard containers for safe handling.

c) Storage: American Industrial heat exchangers are protected against the elements during shipment. If the heat exchanger cannot be installed and put into operation immediately upon receipt, certain precautions are required to prevent deterioration during storage. The responsibility for integrity of the heat exchanger(s) is assumed by the user. American Industrial will not be responsible for damage, corrosion, or other deterioration of the heat exchanger during transit or storage.

Proper storage practices are important when considering the high costs of repair or replacement, and the possible delays for items which require long lead times for manufacture. The following listed practices are provided solely as a convenience to the user, who shall make their own decision on whether to use all or any of them.

1) Heat exchangers not to be placed in immediate service, require precautionary measures to prevent corrosion or contamination.
2) Heat exchangers made of ferrous materials, may be pressure-tested using compressed air at the factory. Residual oil coating on the inside surfaces of the heat exchanger(s) as a result of flushing does not discount the possibility of internal corrosion. Upon receipt, fill the heat exchanger(s) with the appropriate grade of oil or apply a corrosion preventing inhibitor for storage.
3) Corrosion protection compounds for interior surfaces for long term storage or other applications are applied solely at the request of customers. Upon request, American Industrial can provide a customer approved corrosion preventative if available when included in the original purchase order specifications.
4) Remove all dirt, water, ice, or snow and wipe dry before moving heat exchanger(s) into storage. Heat exchangers are generally shipped empty, open drain plugs to remove any accumulated condensation moisture, then reseal. Accumulation of moisture usually indicates corrosion has already started and remedial action should be taken.
5) Store in a covered, environmentally stable area. The ideal storage environment for heat exchangers is in a dry, low-humidity atmosphere which is sealed to prevent the entry of blowing dust, rain, or snow. Maintain in atmospheric temperatures between 70°F and 105°F (Large temperature swings may cause condensation and moisture to form on steel components, threads, shell, etc...) Use thermometers and humidity indicators and maintain the atmosphere at 40% relative humidity, or lower.

d) Standard Enamel Coating: American Industrial provides its standard products with a normal base coat of oil base air cure enamel paint. The enamel paint is applied as a temporary protective and esthetic coating prior to shipment. While the standard enamel coating is durable, American Industrial does not warranty it as a long-term finish coating. It is strongly suggested that a more durable final coating be applied after installation or prior to long-term storage in a corrosive environment to cover any accidental scratches, enhance esthetics, and further prevent corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

e) Special Coatings: American Industrial offers as customer options, Air-Dry Epoxy, and Heresite (Air-Dry Phenolic) coatings at additional cost. American Industrial offers special coatings upon request, however American Industrial does not warranty coatings to be a permanent solution for any equipment against corrosion. It is the responsibility of the customer to provide regular maintenance against chips, scratches, etc... and regular touch up maintenance must be provided for long-term benefits and corrosion prevention.

f) American Industrial recommends that the equipment supplied should be installed by qualified personnel who have solid understanding of system design, pressure and temperature ratings, and piping assembly. Verify the service conditions of the system prior to applying any shell & tube heat exchanger. If the system pressure or temperature does not fall within the parameters on model rating tag located on the heat exchanger, contact our factory prior to installation or operation.

note: AIHTI reserves the right to make reasonable design changes without notice.
Copyright © 2019 - 2020 American Industrial Heat Transfer, Inc. 355 American Industrial Drive LaCrosse, VA 23950 tel: 434-757-1800 fax: 434-757-1810 email: sales@aihti com

g) Plan the installation to meet the requirements indicated on the piping installation diagram as illustrated above. It is recommended to put the hot fluid to be cooled through the shell side and the cold fluid through the tube side. The indicated port assembly sequence in the installation diagram maximizes the performance, and minimizes the possibility of thermal shock. In instances where the fluids are required to be reversed, *hot fluid in the tubes and cold fluid in the shell* the heat exchanger will work with reduced performance. Installation may be vertical or horizontal or a combination thereof. However, the installation must allow for complete draining of the heat exchanger regardless of Two Pass or four pass construction. Complete drainage is important to prevent the heat exchanger from freezing, over-heating of a fluid, or mineral deposit buildup.
For removable bundle heat exchangers, provide sufficient clearance at the stationary tube-sheet end to allow for the removal of the tube bundle from the shell. Channel cover can be removed to aid in cleaning the tubes without disassembling the tube bundle. For more information please contact American Industrial.

h) It is recommended to use flexible hose wherever possible to reduce vibration and allow slight movement. However, hoses are not required. Hydraulic carrying lines should be sized to handle the appropriate flow and to meet system pressure drop requirements based upon the systems parameters, and not based upon the units supply and return connection size. We recommend that a low cracking pressure direct acting relief valve be installed at the heat exchanger inlet to protect it from pressure spikes by bypassing oil in the event the system experiences a high flow surge. If preventative filtration is used it should be located ahead of the cooler on both shell and tube side to catch any scale or sludge from the system before it enters the cooler. Failure to install filters ahead of the heat exchanger could lead to possible heat exchanger failure due to high pressure if the system filters plug.

i) Standard shell & tube coolers are built with a rolled tube-sheet construction. However, the differential operating temperature between the entering shell side fluid and the entering tube side fluid should not exceed 150°F. If this condition exists, a severe thermal shock could occur leading to product failure and mixing of the fluids. For applications with a differential temperatures of 150°F or more, we recommend using a series with a floating tube-sheet, u-tube, or expansion joint to reduce the potential for the effects of thermal shock.

j) Water requirements vary from location to location. If the source of cooling water is from other than a municipal water supply, it is recommended that a water strainer be installed ahead of the heat exchanger to prevent dirt and debris from entering and clogging the flow passages. If a water modulating valve is used it is recommended to be installed at the inlet to the cooler to regulate the water flow.

k) For steam service, or other related applications, please consult our engineering department for additional information.

Maintenance
a) Inspect the heat exchanger for loosened bolts, connections, rust spots, corrosion, and for internal or external fluid leakage. Any corroded surfaces should be cleaned and recoated with paint.

b) Shell side: In many cases with clean hydraulic system oils it will not be necessary to flush the interior of the shell side of the cooler. In circumstances where the quality of hydraulic fluid is in question, the shell side should be disconnected and flushed on a yearly basis with a clean flushing oil/solvent to remove any sludge that has been deposited. For severe cases where the unit is plugged and cannot be flushed clean with solvent, the heat exchanger should be replaced to maintain the proper cooling performance.

c) Tube side: In many cases it will be necessary to clean the tube side of the heat exchanger due to poor fluid quality, debris, calcium deposits, corrosion, mud, sludge, seaweed, etc.... To clean the tube side, flush with clean water or any good quality commercial cleaner that does not attack the particular material of construction. With straight tube heat exchangers you can use a rod to carefully push any debris out of the tubes.

d) Zinc anodes are normally used to reduce the risk of failure due to electrolysis. Zinc anodes are a sacrificial component designed to wear and dissolve through normal use. Normally, zinc anodes are applied to the water supply side of the heat exchanger. Depending upon the amount of corrosive action, one, two, three, or more anodes can be applied to help further reduce the risk of failure. American Industrial Heat Transfer, Inc. offers zinc anodes as an option, to be specified and installed at the request our customers. It is the responsibility of the customer to periodically check and verify the condition of the zinc anode and replace it as needed.

Applications vary due to water chemical makeup and quality, material differences, temperature, flow rate, piping arrangements, and machine grounding. For those reasons, zinc anodes do not follow any scheduled factory predetermined maintenance plan moreover they must be checked routinely by the customer, and a maintenance plan developed based upon the actual wear rate.

If substantial wear occurs or zinc dissolves without replacement, premature failure or permanent damage may occur to the heat exchanger. American Industrial does not warranty customer applications. It is the responsibility of the customer to verify and apply the proper system materials of construction and overall system requirements. Failures resulting from properly applied or misapplied use of zinc anode(s) into non-specified or specified applications will be the sole responsibility of the customer.

e) A routine maintenance schedule should be developed and adjusted to meet your systems requirements based upon water quality, etc... .Failure to regularly maintain and clean your heat exchanger can result in a reduction in operational performance and life expectancy.

Note: *Since applications can vary substantially, the installation and maintenance information contained in this catalog should be used as a basic guideline. The safe installation, maintenance, and use of any American Industrial Heat Transfer, Inc. heat exchanger are solely the responsibility of the user.*

Attachment C

IEPA Letter Dated 12/20/2019

Illinois Environmental Protection Agency

1021 North Grand Avenue East • P.O. Box 19276 • Springfield • Illinois • 62794-9276 • (217) 782-3397

RCRA Permit Application Form (LPC-PA23)

View Instructions

This form must be used for any permit application for a hazardous waste management facility regulated in accordance with RCRA, Subtitle C, including all requests to modify an existing permit. One original and three (3) copies, of all permit applications must be submitted. Attach the original and appropriate number of copies of a cover letter, any necessary plans, specifications, reports, forms, (e.g., corrective action certification form), and any other certifications etc. to fully support and describe the activities or modifications being proposed. Attach sufficient information to demonstrate compliance with all applicable regulatory requirements. Applications without this form will be deemed incomplete. Please refer to the RCRA checklist and decision guide documents for further guidance. For RCRA corrective action, this form should only be used if requesting an actual modification to a RCRA permit. A RCRA Corrective Action Certification form should be used in all other instances.

Note: Permit applications which are hand-delivered to the Bureau of Land, Permit Section must be delivered to 1021 North Grand Avenue East between the hours of 8:30 a.m. to 5:00 p.m., Monday through Friday (excluding State holidays).

Please type or print all information legibly.

I. Site Identification

Site # (Illinois EPA): 1191150002 USEPA ID Number: ILD080012305

Site Name: Equilon Enterprises LLC d/b/a Shell Oil Products US (SOPUS)

Physical Site Location (street, road, etc.): 900 South Central Avenue

City: Roxana Zip Code: 62084 County: Madison

Existing RCRA Permit (if applicable): B-43R

II. Owner/Operator Identification

Owner Information

Name: WRB Refining LP

Mailing Address:

2331 City West Blvd
Houston, TX 77042

Contact Name: Tom Morgan

Phone #: 618-255-2142

Email: thomas.r.morgan@p66.com

Operator Information

Name: Equilon Enterprises LLC d/b/a SOPUS

Mailing Address:

150 North Dairy Ashford
Building A, 5th Floor
Houston, TX 77079

Contact Name: Dan Kirk

Phone #: 281.544.9796

Email: dan.kirk@shell.com

A 39(i) certification must be submitted with information concerning the following persons or entities:

- the owner of the business entity applying for the permit;
- the operator of the business entity applying for the permit;
- each employee or officer of the owner or operator who signed the permit application or has managerial authority at the site; and
- any additional owner, operator, or officer or employee of the owner or operator from whom a certification is requested by the Illinois EPA, including any officer or employee who will be responsible for overseeing or implementing regulated activities governed by the permit.

III. Permit Application Identification

Application Type

- ☐ New Part B Permit
- ☐ Part B Permit Renewal
- ☐ Class 1 Modification
- ☑ Class 1* (prior approval required) Modification
- ☐ Class 2 Modification
- ☐ Class 3 Modification
- ☐ Additional information to supplement UIC Class I application Log Number

_____

- ☐ Remedial Action Plan Permit (RAPP)
- ☐ Sig RAPP Modification
- ☐ Non Sig RAPP Modification
- ☐ Major UIC Modification
- ☐ Minor UIC Modification

This Application Involves

☐ Storage	☐ Treatment	☐ Disposal	☐ Incineration
☑ Groundwater	☑ Corrective Action	☐ UIC Class I	☐ UIC Class V

Description of This Permit Request: (Include a brief narrative description here.)

Response to Condition V.D.3. of the 12/20/2019 Modified Permit requesting installation of a new groundwater monitoring well (B-43R-M-29).

IV. SIGNATURES

Original signatures required. Signature stamps or applications transmitted electronically or by facsimile are not acceptable. All applications shall be signed by the person in accordance with 35 IAC 702.126(a).

Please check the box of the appropriate certification.

Owner

☐ I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons that manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Alternative owner certification. For remedial action plans (RAPs) permit under Subpart H of 35 IAC 703, the owner may choose to make the following certification instead of the certification above.

☒ Based on my knowledge of the conditions of the property described in the RAP and my inquiry of the person or persons that manage the system referenced in the operator's certification, or those persons directly responsible for gathering the information, the information submitted is, upon information and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

All information submitted as part of the Application is available to the public except when specifically designated by the Applicant to be treated confidentially as a trade secret or secret process in accordance with Section 7(a) of the Environmental Protection Act, applicable Rules and Regulations of the Illinois Pollution Control Board and applicable Illinois EPA rules and guidelines.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent offense after conviction is a Class 3 felony. (415 ILCS 5/44(h))

Instructions for
RCRA Permit Application Form LPC-PA23

Return to Page 1

The following instructions are designed to aid in the completion of the RCRA Permit Application Form LPCPA23. If you have additional questions regarding the form, or the informational requirements, please contact the Illinois EPA Bureau of Land (BOL) Permit Section at 217-524-3300.

This form must be used for any permit application for a hazardous waste management facility regulated in accordance with RCRA, Subtitle C, including all requests to modify an existing permit. If an application has already been submitted to the Agency, a completed RCRA Permit Application Form must accompany all additional information that is submitted to the agency for that application. An example of "additional information" would be a response to verbal or written comments from the Agency. For RCRA corrective action, this form should only be used if requesting an actual modification to a RCRA permit. A RCRA Corrective Action Certification form should be used in all other instances.

I. Site Identification

Enter all of the required information in the space provided. If you do not have an Illinois or USEPA identification number, call the Illinois EPA BOL Waste Reduction and Compliance Section at 217-785-8604 to obtain these numbers prior to completing the form.

II. Owner/Operator Identification

The terms "owner" and "operator" are defined at 35 IAC 720.110 and 702.110. If the facility has the same owner and operator, you may type in "same" under operator information. Also, if the contact person for an application is different from the owner or operator (i.e. the consultant), please indicate this in the cover letter for the application.

III. Permit Application Identification

Indicate both the type of application and the kind of waste management involved. For instance, if the application involves more than one type of waste management, check all applicable options.

IV. Signatures

The signatory requirements for permit applicants are identified at 35 IAC 702.126 and 702.151. If the facility has the same owner and operator, you may type in "same" under operator information.

Notary Public: A notary public's signature and stamp are required for both the owner and operator signatures on the form.

Engineer Certification: A professional engineer that is licensed in the State of Illinois must certify all technical information provided in a permit application. 35 IAC 703.182 describes the types of information that must be certified by a professional engineer.

Illinois Environmental Protection Agency

1021 North Grand Avenue East • P.O. Box 19276 • Springfield • Illinois • 62794-9276 • (217) 782-3397

39(i) Certification
for Operating a Waste Management Facility

Pursuant to 415 ILCS 5/39(i), prior to issuing any RCRA permit, or any permit for a waste storage site, sanitary landfill, waste disposal site, waste transfer station, waste treatment facility, waste incinerator, clean construction or demolition debris fill operation, or used tire storage site, the Illinois EPA must conduct an evaluation of the prospective owner's or operator's prior experience in waste management operations, clean construction or demolition debris fill operations, and tire storage site management. As part of that evaluation please complete and submit this form with your permit application.

This form may be completed online and saved locally before printing, signing and submitting it to the Illinois EPA at the address below. If the form is completed manually, please type or print clearly.

Illinois Environmental Protection Agency
Division of Land Pollution Control - #33
39(i) Certification
1021 North Grand Avenue East
P.O. Box 19276
Springfield, IL 62794-9276

I. Applicant Information

Site Name: Equilon Enterprises LLC d/b/a Shell Oil Products US IEPA BOL No.: 1191150002

Site Address: 900 South Central Avenue

City: Roxana State: IL Zip Code: 62084

Permit Numbers (if applicable): B-43R

Owner

Owner Name: WRB Refining LP

Street Address: 2331 City West Blvd

City: Houston State: TX Zip: 77042

Operator

Operator Name: Equilon Enterprises LLC dba SOPUS

Street Address: 150 N Dairy Ashford, Bldg A, 5th Floor

Is this 39(i) certification for the owner or the operator?

◯ Owner ⊘ Operator ◯ Owner and operator are the same entity

II. Officers and Employees with Site Responsibility

Unless the owner and operator are the same entity, a separate 39(i) form must be submitted for both the owner and operator. Persons operating under the authority of the owner should be listed on the owner's 39(i) form and persons operating under authority of the operator should be listed on the operator's 39(i) form.

A. Officers: List the name and title of all officers of the owner or operator that will have personal involvement or active participation in the operation or management of the site or facility for which the application is submitted.

Name	Title
Dan Kirk	Principal Program Manager

B. Employees: List the name and title of each employee of the owner or operator that will have personal involvement or active participation in the overall operation or management of the site or facility for which the application is submitted (e.g. site managers, site engineers, and other persons who direct or control the overall day-to-day management of the operation, but not persons whose duties are exclusively limited to equipment operation, labor, or similar non-managerial functions).

Name	Title
Wendy Pennington	AECOM, Project Manager
Bob Billman	AECOM, Project Manager

III. Owner, Operator, Officer, and Employee Information

A. Prior Conduct Identification

The applicant must answer each of the following questions for every owner or operator, and for any officer or employee identified under Section II. If the answer to any of the following questions is affirmative, the applicant must complete an Attachment A for each person for whom the answer is affirmative and include a copy of each final administrative or judicial determination that required an affirmative response. If the information for each owner, operator, officer, and employee has not changed since the applicant's last submission of a 39(i) certification, the applicant can skip to Section III(C), below.

1) Has there been a finding that any person named in Section II violated federal, State, or local laws, regulations, standards, or ordinances in the operation of one or more waste management facilities or sites, clean construction or demolition debris fill operation facilities or sites, or tire storage sites? ○ Yes ⊘ No

2) Has any person named in Section II ever been convicted in this or another State of any crime which is a felony under the laws of this State, or convicted of a felony in a federal court; or convicted in this or another state or federal court of any of the following crimes: forgery, official misconduct, bribery, perjury, or knowingly submitting false information under any environmental law, regulation, or permit term or condition? ○ Yes ⊘ No

3) Has there been a finding against any person named in Section II of gross carelessness or incompetence in handling, storing, processing, transporting or disposing of waste, clean construction or demolition debris, or used or waste tires, or a finding of gross carelessness or incompetence in using clean construction or demolition debris as fill? ○ Yes ⊘ No

B. Pending Proceedings

The applicant must answer each of the following questions for every owner or operator, and for any officer or employee identified in Section II. If the answer to any of the following questions is affirmative, the applicant must complete an Attachment A for each person for whom the answer is affirmative and provide information identified in Attachment A regarding the pending proceeding.

1. Is there any proceeding currently pending against any person named in Section II that could result in a conviction or finding described in subsection A, above? ○ Yes ⊘ No

2. Is there any proceeding currently pending against any person named in Section II that could result in the reversal of a conviction or finding described in subsection A, above? ○ Yes ⊘ No

C. Prior Application Information

If (i) the applicant has previously submitted the Attachments required pursuant to subsections A and B above and (ii) the Attachments previously submitted are still complete, true, and correct, then the applicant does not need to include Attachments with this submission if fhe following box is checked:

☑ By checking this box, I affirm that the Attachments previously submitted are still complete, true, and correct and wish to incorporate them into this Certification.

If the above box is checked, identify the application that contains the previously submitted Attachments that are complete, true, and correct.

RCRA Post-Closure Permit Renewal Application, EPA ID No. ILD080012305, Log No. B-43R2

Authorization for Release of Information

This Certification must be signed by an officer of the applicant.

The undersigned authorizes any representative of the Illinois Environmental Protection Agency bearing this release to obtain any information from the Illinois State Police pertaining to the criminal records of the applicant and hereby directs the Illinois State Police to release such information upon request of the bearer. The undersigned authorizes a review of and full disclosure of all records, or any part thereof, concerning the applicant's criminal records by and to a duly authorized agent of the Illinois Environmental Protection Agency, whether the records are of public, private, or confidential nature. The intent of this authorization is to give consent for full and complete disclosure of the applicant's criminal records.

The undersigned fully understands that any information which is developed directly or indirectly, in whole or in part, as a result of this authorization will be considered in determining whether a permit shall be issued by the Illinois Environmental Protection Agency under the Environmental Protection Act [415 ILCS 5]. The undersigned further agrees to release the Illinois State Police and the Illinois Environmental Protection Agency, its agents and designees under this release, from any and all liability which may be incurred as a result of compliance with this authorization for release of information.

Certification Statements

I certify under penalty of law that the information submitted, including information on any Attachments submitted as part of or incorporated into this Certification, is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent offense after conviction is a Class 3 felony. (415 ILCS 5/44(h))

39(i) Certification
for Operating a Waste Management Facility

Pursuant to 415 ILCS 5/39(i), prior to issuing any RCRA permit, or any permit for a waste storage site, sanitary landfill, waste disposal site, waste transfer station, waste treatment facility, waste incinerator, clean construction or demolition debris fill operation, or used tire storage site, the Illinois EPA must conduct an evaluation of the prospective owner's or operator's prior experience in waste management operations, clean construction or demolition debris fill operations, and tire storage site management. As part of that evaluation please complete and submit this form with your permit application.

This form may be completed online and saved locally before printing, signing and submitting it to the Illinois EPA at the address below. If the form is completed manually, please type or print clearly.

Illinois Environmental Protection Agency
Division of Land Pollution Control - #33
39(i) Certification
1021 North Grand Avenue East
P.O. Box 19276
Springfield, IL 62794-9276

I. Applicant Information

Site Name: Equilon Enterprises LLC d/b/a Shell Oil Products US
IEPA BOL No.: 1191150002
Site Address: 900 South Central Avenue
City: Roxana
State: IL
Zip Code: 62084
Permit Numbers (if applicable): B-43R

Owner

Owner Name: WRB Refining LP
Street Address: 2331 City West Blvd
City: Houston
State: TX
Zip: 77042

Operator

Operator Name: Equilon Enterprises LLC dba SOPUS
Street Address: 150 N Dairy Ashford, Bldg A, 5th Floor
City: Houston
State: TX
Zip: 77079

Is this 39(i) certification for the owner or the operator?

☑ Owner ○ Operator ○ Owner and operator are the same entity

II. Officers and Employees with Site Responsibility

Unless the owner and operator are the same entity, a separate 39(i) form must be submitted for both the owner and operator. Persons operating under the authority of the owner should be listed on the owner's 39(i) form and persons operating under authority of the operator should be listed on the operator's 39(i) form.

A. Officers: List the name and title of all officers of the owner or operator that will have personal involvement or active participation in the operation or management of the site or facility for which the application is submitted.

Name	Title
Gerald Knoyle	Refinery Manager

B. Employees: List the name and title of each employee of the owner or operator that will have personal involvement or active participation in the overall operation or management of the site or facility for which the application is submitted (e.g. site managers, site engineers, and other persons who direct or control the overall day-to-day management of the operation, but not persons whose duties are exclusively limited to equipment operation, labor, or similar non-managerial functions).

Name	Title
Thomas Morgan	Environmental Director

III. Owner, Operator, Officer, and Employee Information

A. Prior Conduct Identification

The applicant must answer each of the following questions for every owner or operator, and for any officer or employee identified under Section II. If the answer to any of the following questions is affirmative, the applicant must complete an Attachment A for each person for whom the answer is affirmative and include a copy of each final administrative or judicial determination that required an affirmative response. If the information for each owner, operator, officer, and employee has not changed since the applicant's last submission of a 39(i) certification, the applicant can skip to Section III(C), below.

1) Has there been a finding that any person named in Section II violated federal, State, or local laws, regulations, standards, or ordinances in the operation of one or more waste management facilities or sites, clean construction or demolition debris fill operation facilities or sites, or tire storage sites? ◯ Yes ⊘ No

2) Has any person named in Section II ever been convicted in this or another State of any crime which is a felony under the laws of this State, or convicted of a felony in a federal court; or convicted in this or another state or federal court of any of the following crimes: forgery, official misconduct, bribery, perjury, or knowingly submitting false information under any environmental law, regulation, or permit term or condition? ◯ Yes ⊘ No

3) Has there been a finding against any person named in Section II of gross carelessness or incompetence in handling, storing, processing, transporting or disposing of waste, clean construction or demolition debris, or used or waste tires, or a finding of gross carelessness or incompetence in using clean construction or demolition debris as fill? ◯ Yes ⊘ No

B. Pending Proceedings

The applicant must answer each of the following questions for every owner or operator, and for any officer or employee identified in Section II. If the answer to any of the following questions is affirmative, the applicant must complete an Attachment A for each person for whom the answer is affirmative and provide information identified in Attachment A regarding the pending proceeding.

1. Is there any proceeding currently pending against any person named in Section II that could result in a conviction or finding described in subsection A, above? ◯ Yes ⊘ No

2. Is there any proceeding currently pending against any person named in Section II that could result in the reversal of a conviction or finding described in subsection A, above? ◯ Yes ⊘ No

C. Prior Application Information

If (i) the applicant has previously submitted the Attachments required pursuant to subsections A and B above and (ii) the Attachments previously submitted are still complete, true, and correct, then the applicant does not need to include Attachments with this submission if fhe following box is checked:

☑ By checking this box, I affirm that the Attachments previously submitted are still complete, true, and correct and wish to incorporate them into this Certification.

If the above box is checked, identify the application that contains the previously submitted Attachments that are complete, true, and correct.

RCRA Post-Closure Permit Renewal Application, EPA ID No. ILD080012305, Log No. B-43R2

Authorization for Release of Information

This Certification must be signed by an officer of the applicant.

The undersigned authorizes any representative of the Illinois Environmental Protection Agency bearing this release to obtain any information from the Illinois State Police pertaining to the criminal records of the applicant and hereby directs the Illinois State Police to release such information upon request of the bearer. The undersigned authorizes a review of and full disclosure of all records, or any part thereof, concerning the applicant's criminal records by and to a duly authorized agent of the Illinois Environmental Protection Agency, whether the records are of public, private, or confidential nature. The intent of this authorization is to give consent for full and complete disclosure of the applicant's criminal records.

The undersigned fully understands that any information which is developed directly or indirectly, in whole or in part, as a result of this authorization will be considered in determining whether a permit shall be issued by the Illinois Environmental Protection Agency under the Environmental Protection Act [415 ILCS 5]. The undersigned further agrees to release the Illinois State Police and the Illinois Environmental Protection Agency, its agents and designees under this release, from any and all liability which may be incurred as a result of compliance with this authorization for release of information.

Certification Statements

I certify under penalty of law that the information submitted, including information on any Attachments submitted as part of or incorporated into this Certification, is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Any person who knowingly makes a false, fictitious, or fraudulent material statement, orally or in writing, to the Illinois EPA commits a Class 4 felony. A second or subsequent offense after conviction is a Class 3 felony. (415 ILCS 5/44(h))

Springfield, IL 62794

Class 1* Permit Modification Request –
Response to Condition 4.b. in Attachment A and Condition V.D.3. of the 12/20/2019 IEPA Letter with Modified Permit
Equilon Enterprises LLC d/b/a Shell Oil Products US
Roxana, Illinois
1191150002 - Madison County (ILD080012305)
Log No. B-43R-M-29

Dear Mr. Smith,

AECOM Technical Services, Inc. (AECOM), on behalf of Equilon Enterprises LLC d/b/a Shell Oil Products US (SOPUS), is providing this letter in response to the Illinois Environmental Protection Agency's (IEPA's) December 20, 2019 letter. In that letter, the IEPA approved several modification requests submitted between February 22, 2015 and January 29, 2018 for the RCRA Hazardous Waste Post-Closure Permit (Permit) for the Wood River Refinery (WRR) and included a modified Permit. The IEPA also included a condition requesting the installation of new groundwater monitoring well, to be added to the Roxana Interim Groundwater Monitoring Program.

Condition 4.b. in Attachment A of the IEPA December 20, 2019 letter and Condition V.D.3. of the enclosed modified Permit requested the installation of new groundwater monitoring well, to be added to the Roxana Interim Groundwater Monitoring Program, to "intercept potential groundwater contamination observed in the B-level well, P-93B".

For reference purposes, "A" level wells were screened across the water table at the time of installation. "B", "C" and "D" level wells are distributed throughout the rest of the Main Sand aquifer, and not with respect to a particular soil unit.

The most recent submittal reviewed by and included in the IEPA December 20, 2019 letter was a Permit Modification request dated January 30, 2018. Since January 2018, additional information has been collected at the Roxana Public Works Yard (PWY) to refine the Conceptual Site Model (CSM). This work was conducted by AECOM in June and July 2019 and included collecting groundwater samples from multiple depths (groundwater profiling (GWP)) at locations throughout the PWY as depicted on **Figure 1** enclosed with this letter. **Table 1** provides a summary of the groundwater sample depths and elevations at these locations.

The groundwater samples from the Public Works Yard 2019 data collection were analyzed for the same compounds as in the Roxana Interim Groundwater Program. Benzene was found to be the main constituent of concern of the detections during this investigation. The modeled benzene results for groundwater samples are shown in cross section view in **Figures 2a, 2b, 2c, 2d,** and **2e**.

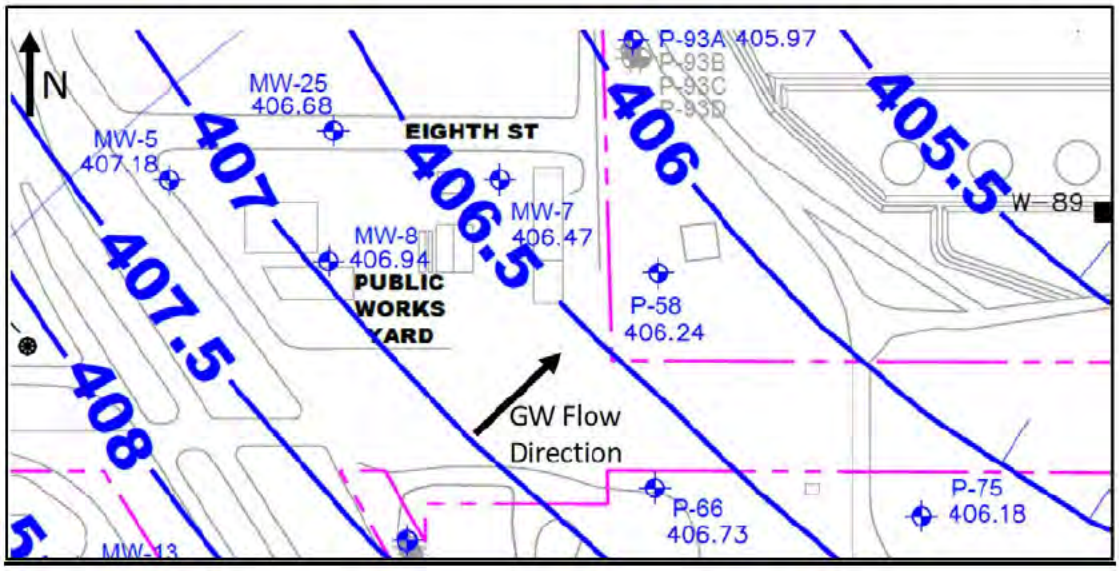
The following groundwater monitoring wells, among others throughout Roxana and WRR, are sampled each quarter as part of the Roxana Interim Groundwater Monitoring Program (Roxana Program). **Figure 1** shows the location of these monitoring wells. **Table 1** provides a summary of the screened intervals, sample depths and elevations for these groundwater monitoring wells.

North Property	Village of Roxana	West Property	Main Property
P-58*	MW-5*	MW-13*	MW-6A
P-93A	MW-7*	P-114R*	MW-6B
P-93B	MW-8*		MW-6C
P-93C	MW-23*		MW-6D
P-93D	MW-25*		P-66*

* A-level well

The PWY GWP activities were performed during the same timeframe as the 3rd quarter 2019 (3Q19) quarterly groundwater sampling event. GWP samples were collected at approximately 10-foot intervals and/or as indicated by field observations during other investigation activities (e.g., CPT/DyeLIF); some of the depths sampled coincidentally corresponded to screened elevations in the A-, B- and C- level wells at the MW-6 and P-93 well clusters. The benzene concentrations observed during the 3Q19 and GWP groundwater sampling activities are presented on **Figure 3** along with groundwater elevation contours from the 3Q19 groundwater gauging event.

Groundwater occurs at approximately elevation 407 North American Vertical Datum (NAVD 88), based on the 3Q19 measurement in monitoring well MW-8 in the western portion of the PWY. Groundwater in this area is controlled by the water production system pumping at the WRR (minimum 3,000 gallons per minute daily average), which creates an aggregate cone of depression and resultant hydraulic gradient directed toward the pumping centers. The following figure, excerpted from Figure 3b in the 3Q19 quarterly report for the Roxana Interim Groundwater Monitoring Program, shows typical groundwater flow directions, with flow inward toward the WRR pumping wells (e.g., W-89).



Groundwater elevations observed in 3Q19 were unusually high, influenced in part by above-average precipitation in the first half of 2019 and flood conditions in the Mississippi River. From 2010 through 3Q19 the groundwater elevation in the vicinity of the PWY has ranged from approximately 399 to 407 feet NAVD 88, with flow inward toward the WRR pumping wells.

The highest groundwater benzene concentrations occur from the groundwater surface to a depth of approximately 54 feet below ground surface (bgs). Below the 54-foot depth bgs, concentrations were predominantly less than 1 mg/L during the 2019 data collection; an exception to this was observed in the northeastern portion of the PWY where, likely as a result of the WRR pumping, concentrations up to 1,200 mg/L were detected to a depth of about 71 feet bgs. Based on groundwater analytical data, benzene concentrations are lowest in the western portion of the Public Works Yard. For reference, the 3Q19 benzene concentrations from the P-93 well cluster are listed below:

Well ID	Benzene Concentration (mg/L)
P-93A	10
P-93B	170 / 220 *
P-93C	<0.001
P-93D	0.0012

* Indicates duplicate sample collected and analyzed

Prior to the installation of the MW-6 well cluster (south of the PWY) and monitoring well MW-13 (southwest of the PWY), GWP activities were performed at these two well locations (GWP-22 and GWP-27, respectively) in September and October 2010. This was during the same timeframe as the 4th quarter 2010 (4Q10) quarterly groundwater sampling event. Prior to the installation of monitoring well MW-23 (west of PWY), GWP activities were performed at this well location (GWP-28) in October 2012. Various depths sampled during the 2010 and 2012 GWP events correspond to screened elevations in the A-, B-, C- and D- levels wells at the P-93 well cluster and to PWY GWP sample depths. The benzene concentrations observed during the GWP and 4Q10 groundwater sampling activities are presented on **Figure 4** along with groundwater elevation contours from the 4Q10 groundwater gauging event.

Conclusions

Data has been collected over the course of the past decade. A review of data from historic (2010 and 2012) and more recent (3Q19) GWP and quarterly groundwater sampling events indicates benzene concentrations are highest at depths that coincide with the A- level and B- level well depths. Benzene concentrations are currently highest in the eastern half of the PWY and extending into the WRR due to 20+ years of groundwater capture. The groundwater in this area, WRR Main and North Properties, is captured within the water production system radius of influence. Benzene concentrations decrease to the west and south (upgradient) of the PWY. Benzene concentrations observed at MW-13 (located to the west and upgradient of the P-93 well cluster and PWY), on the West Property and in the A- and B- level wells at the MW-6 well cluster (located to the south and upgradient of the P-93 well cluster and PWY) are below 0.005 mg/L and/or non-detect. A thermal treatment system is currently being designed for the PWY with the objective of accelerating the reduction of hydrocarbons in targeted areas. Dissolved concentrations outside the thermal treatment zone will continue to improve. The need for additional groundwater monitoring will be assessed as part of the design process.

Based on the review of these data and information, the B- level impact observed in P-93B has been delineated to the west, and as such, installation of a new groundwater monitoring well for the Roxana Program does not appear to be necessary at this time, and as such is not proposed. It is requested that Condition V.D.3. be removed from the Permit. As previously mentioned however, additional monitoring may be proposed as part of the thermal treatment effort.

If you have any questions concerning this request, please contact Dan Kirk, SOPUS Principal Program Manager, at 832-337-8276 or dan.kirk@shell.com, or me at 314-452-8929 or wendy.pennington@aecom.com.

NOTES

NAVD 88 — North American Vertical Datum
mg/L — milligrams per liter

1. Lithology and concentrations of benzene in groundwater were modeled using CTECH's Earth Volumetric Studio (EVS), version 2019.2;
2. Contour lines are in orders of magnitude, starting at 100 mg/L.
3. Modeled lithology was based on CPT data collected at 18 locations on June 10 - June 20, 2019, except the upper 10 feet, which was based on hand auger logs.
4. Benzene in groundwater was modeled using EVS' Krig Statistics method. The dataset includes predesign concentrations of benzene in groundwater at the site, as well as concentrations from the 3Q19 Roxana Interim Groundwater Monitoring Program.
5. Locations within 15 feet were projected onto the cross section line.
6. The approximate groundwater surface was modeled using gauging data from the 3Q19 Roxana Interim Groundwater Monitoring Program.
