At the request of Shell Oil Products US (SOPUS), URS Corporation (URS) designed and constructed an extension of the Soil Vapor Extraction (SVE) system (System) previously constructed along the west boundary (West Fenceline) of the Wood River Refinery (WRR) North Property, in the Village of Roxana, Illinois (Village) and within the Village Public Works (PW) Yard. The West Fenceline portion of the System was installed between March 2011 and January 2012, as presented in the May 2012 *SVE System Construction Completion Report* (CCR). After an access agreement was executed between SOPUS and the Village on October 5, 2012, the PW Yard portion of the System was installed in October and November 2012, as presented in the February 14, 2013 *SVE System Construction Completion Report Addendum*. This report documents an extension of the West Fenceline portion of the system to the north. The purpose of this Construction Completion Report (CCR) Addendum (Addendum No. 2) is to provide information regarding System layout and construction activities for the SVE System Extension. This addendum was formatted in a consistent manner with the previous CCR addendum.

1.1 SITE BACKGROUND

The WRR is composed of five areas, including the North Property, which contains storage tanks and most of the current and past waste management areas. Located in the Village at 900 South Central Avenue, WRR was operated by Shell Oil Company and subsequent owners until ownership changed to ConocoPhillips (COP) effective June 1, 2000. WRB Refining LLC, formed January 1, 2007, was a 50/50 joint venture between COP and EnCana US Refineries, LLC. On December 31, 2010, WRB Refining LLC was converted into a limited partnership named WRB Refining LP (WRB) with limited partners COP and Cenovus US Refinery Holdings. ConocoPhillips Company announced the separation of their Refining and Marketing business from their Exploration & Production business on July 14, 2011. The separation included an ownership change as well as a name change that became effective May 1, 2012. Phillips 66 (P66) is now the operator of WRR. Equilon Enterprises LLC (d/b/a Shell Oil Products US (SOPUS)) is working with the assistance of P66 on several environmental projects and programs.

Subsurface investigations have been conducted within the area generally bounded by Illinois Route 111 to the west, the West Fenceline to the east, East 1st Street to the north, and Rand Avenue to the south and within the WRR along the West Fenceline (**Figure 1**). This area will be referred to as the “Site.”

The previously constructed SVE System area is located on the North Property, along the West Fenceline, between Second and Eighth Streets in the Village and on the Village Public Works

property south of Eighth Street (**Figure 2**). The construction area for the SVE System Extension is presented on **Figure 2A**.

1.2 SOIL VAPOR EXTRACTION

On behalf of SOPUS, URS designed and installed an SVE System to address vapor detected in the Village. The SVE System final design was submitted to IEPA in the June 2011 *Conceptual/Final Design Report*, which included background information, remedial objectives, and a conceptual approach to meet the remedial objectives. A *Joint Construction and Operating Permit* was issued by IEPA on July 14, 2011 for construction and operation of the SVE System. SOPUS submitted the *SVE System Construction Completion Report* for the West Fenceline portion of the System in May 2012 and the *SVE System Construction Completion Report Addendum* for the PW Yard portion of the SVE System in February 2013. Operation of the West Fenceline and the PW Yard portions of the SVE System commenced on January 31, 2012 and December 3, 2012, respectively. SVE System operation and monitoring activities are documented in quarterly Soil Vapor Sampling and SVE Monitoring Reports.

Based on the results of soil vapor sampling documented in the quarterly reports, in August 2013, SOPUS decided to extend the West Fenceline portion of the system to the north to address soil vapor in and around VMP-47.

As stated above, this CCR Addendum describes the construction activities associated with installation of the SVE System Extension.

Conceptual design drawings used for construction and installation of the SVE System Extension are provided in **Appendix A**.

The SVE System Extension consists of five SVE wells located along the West Fenceline of the WRR North Property (**Figure 2**). The wells were installed on approximately 120-foot spacing based on a design radius of influence (ROI) of 60 feet, which is consistent with the ROI used for design of the West Fenceline portion of the SVE System as documented in the *Conceptual/Final Design Report*. During pre-design investigation activities, which included advancing soil borings for vapor monitoring point (VMP) installation (VMP-57 through VMP-61), the greatest concentrations of soil vapors were observed close to the water table and significant shallow soil impacts were not observed; therefore, the five new SVE wells were screened closer to the water table. Pre-design investigation activities were documented in the *Soil Vapor Sampling and SVE Monitoring Report – 3rd Quarter 2013*, dated October 31, 2013. SVE well construction details are summarized in **Table 1**. Soil boring logs and well installation details for VMP-57 through VMP-61 and SVE-37 through SVE-41 are provided **Appendix B**.

The five SVE System Extension wells (SVE-37, SVE-38, SVE-39, SVE-40, and SVE-41) are an extension of the previously installed “red line” (**Figure 2 and Figure 2A**). The existing “red line” wells are interconnected by 4-inch diameter carbon steel piping. Aboveground piping for SVE-37, which was completed above grade, connects to the aboveground “red line” header between existing wells SVE-5 and SVE-6. Wells SVE-38 through SVE-41, which were completed in below grade vaults, are interconnected by underground piping that connects to the “red line” header above grade near well SVE-5. Three flanged Tee connections were installed on the underground piping to facilitate the potential future connection of additional SVE wells, if needed (Figure 2A).

The SVE System Extension wells are connected via the “red line” to a vapor/liquid separator (VLS) and a rotary lobe positive displacement blower housed within a customized intermodal freight container (conex). Piping from the “red line” SVE wells feeds into the conex, where vapor moves through the VLS, before traveling through the blower and a baffle connected to a Regenerative Thermal Oxidizer (RTO). A second blower, located on the RTO side of the baffle, pushes the vapor into the RTO and adds fresh air to dilute the vapor stream as necessary.

URS contracted Widman Construction, Inc. (Widman) of Godfrey, Illinois to conduct excavation of exploratory trenches in the SVE System Extension area to assess the presence of underground utilities or other underground obstructions that could potentially interfere with construction. Widman conducted hydro-excavation of eight exploratory transect trenches along the West Fenceline between August 21 and September 12, 2013 in the SVE System Extension area. Several underground pipes were observed during trenching. The SVE System Extension well

and underground conveyance piping locations were designed to minimize the potential for encountering these observed underground obstructions during construction. Transect locations and details are provided in **Appendix C**.

Excavated soils were placed in labeled and covered roll-off boxes and managed by URS on behalf of SOPUS. P66 personnel coordinated the transportation and disposal of the solid waste at a properly licensed disposal facility.

There were no deviations from the drawings provided in **Appendix A**.

Construction of the SVE System Extension consisted of the installation of five SVE wells, carbon steel piping, one aboveground stainless steel well enclosure (SVE-37) and four galvanized steel vaults (SVE-38 through SVE-41) along the west fenceline.

URS contracted Roberts Environmental Drilling, Inc. (REDI) of Millstadt, Illinois to install the SVE wells. Gross Mechanical Contractors, Inc. (Gross), of St. Louis, Missouri, was contracted by URS to conduct installation of the piping, aboveground well enclosure, and well vaults. Gross contracted with Widman to perform excavation, backfilling and paving work.

4.1 SVE WELL INSTALLATION ACTIVITIES

SVE System Extension wells SVE-37 through SVE-41 were installed in September 2013. The following subsections provide a brief description of the well installation activities that were performed. SVE well locations are shown on **Figures 2 and 2A**.

4.1.1 Pre-field Activities and Borehole Clearance

Prior to the start of work, the well locations were marked in the field with spray paint. A utility locate was arranged using Illinois' Joint Utility Locating Information for Excavators (JULIE) service. While JULIE provided identification of public utility lines, REDI was contracted to perform private utility locating services using ground penetrating radar (GPR) and electromagnetic (EM) technologies at each location.

Borehole clearance via an air-vacuum system (air-knife) operated by REDI was then used to clear each boring location to a depth of 10 feet with respect to underground utility lines or other obstructions.

Subsurface material observations were made during borehole clearance activities by advancing a hand auger prior to air-knifing to collect grab samples for field-screening and soil classification. An iterative process was used. A soil sample was collected via hand auger, the air knife was used to advance the borehole approximately one foot, and then these steps were repeated to a depth of 10 feet. Observations were noted on the soil boring logs (**Appendix B**).

4.1.2 Drilling and Soil Sampling

All drilling, sampling and well installation activities were performed by REDI. With the exception of SVE-37, drilling and soil sampling was performed with a CME-75 drill rig using 6.25-inch inside diameter (ID) hollow stem augers and split spoon samplers. SVE-37 was completed utilizing a Geoprobe DT-8040 drill rig due to the presence of surface obstructions and limited workspace. For wells SVE-38 through SVE-41, soil sampling was conducted via a split spoon sampler advanced in two-foot increments just below the lead auger. In well SVE-37, soil samples were collected utilizing a 5-foot long acetate liner driven by direct push means, prior to

being over drilled with 6.25-inch ID hollow stem augers. The subsurface stratigraphy was continuously logged by a qualified field scientist in accordance with applicable ASTM standards and the Unified Soil Classification System (USCS). The field scientist noted soil attributes such as color, particle size, consistency, moisture content, structure, plasticity, odor (if obvious), and organic content (if visible). Soil samples were screened in the field using a photoionization detector (PID) and flame ionization detector (FID). Observations were noted on the soil boring logs (**Appendix B**). All soil borings were completed to pre-determined depths ranging from 30-36 feet below ground surface (bgs).

One discrete soil sample was collected for laboratory analysis from the each boring from a depth within the screened interval of each SVE well.

4.1.3 SVE Well Installation

Upon completion of soil sample collection, an SVE well was installed through the augers. The well was constructed using a 4-inch diameter Schedule 40 PVC casing, with a 10-foot section of 0.010-inch slotted PVC well screen. The well screens were set from 25 to 35 feet bgs in wells SVE-37 through SVE-40 and from 20 to 30 feet bgs in well SVE-41, close to the depth to groundwater observed during drilling at each location. The sand pack of each well consisted of silica filter sand placed within the annular space and extended to approximately 2 feet above the top of the well screen. A bentonite seal approximately 2 feet thick was placed above the sand pack. The borehole annulus was then grouted to approximately 4 feet bgs with cement-bentonite grout. SVE well SVE-37 was completed above ground and connected to the existing aboveground SVE system piping. Wells SVE-38 through SVE-41 were completed in below grade vaults and connected to an extension of the existing “red line” SVE header. A summary of well construction details is provided in **Table 1** and well construction diagrams for each well are provided in **Appendix B**.

4.1.4 Sample Handling, Laboratory Testing and Results

Soil samples were collected in laboratory-supplied containers appropriate for the test method and labeled in the field. Pertinent sample information was recorded on the chain of custody (COC) form at the time of sample collection. The COCs can be found with the analytical report in **Appendix D**.

Upon collection and labeling, sample containers were immediately placed inside an iced cooler, packed in such a way as to prevent breakage and maintain an inside temperature at or below 4°C. The samples were then delivered via overnight courier, under the proper COC documentation, to the laboratory for analysis.

A total of 7 soil (5 investigative soil samples, 1 field duplicate soil sample, 1 soil matrix spike and matrix spike duplicate (MS/MSD)), 1 aqueous field equipment blank, and four aqueous VOC trip blank sets were prepared and sent to Accutest Laboratories in Marlborough, Massachusetts. Samples were submitted for the following analysis:

- Method 8260B VOCs
- Method 8011 VOCs
- Method 8270 SVOCs
- Method 8270C SIM – Low Level PAHs
- Method 8015 TPH-GRO

Up to the top 15 tentatively identified compounds (TICs)¹ were also identified with the Method 8260B VOC analysis.

The soil sample collected from SVE-41 and corresponding equipment blank were not analyzed because the sample cooler was delayed in transit and arrived at the laboratory out of temperature range.

A tabular summary of the analytical detections for the soil samples collected during SVE well installation activities is presented in **Table 2**. **Appendix D** contains URS Data Reviews and the laboratory reports with chain of custody forms for the soil data.

4.1.5 Investigation Derived Waste

Investigation derived waste (IDW), including soil cuttings, personal protective equipment (PPE) and expendable materials, and decontamination and development water were collected and disposed of properly. Expendable materials (e.g., disposable sampling equipment such as gloves) having a low probability of impact were collected in trash bags and disposed of as municipal waste. Soil cuttings from the borings were collected and placed directly in a labeled and covered roll-off and managed by URS on behalf of SOPUS. P66 personnel coordinated the transportation and disposal of the solid IDW at a properly licensed disposal facility. Decontamination water was collected and disposed of at a designated WRR sewer inlet for treatment with other wastewater generated at the WRR.

4.2 INSTALLATION OF SVE SYSTEM EXTENSION PIPING

Construction field activities for installation of the SVE System Extension piping were performed between September 23, 2013 and October 22, 2013. Prior to field construction activities,

¹ TICs reported are those present at levels above 10 percent of associated internal standard responses.

portions of the carbon steel piping were shop-fabricated. Hydro-excavation of a trench for installation of underground piping to wells SVE-38 through SVE-41 commenced on September 27, 2013. Following excavation, 4-inch diameter carbon steel piping with cathodic protection was installed, along with galvanized steel well vaults with pre-cast concrete floors.

The carbon steel piping connecting SVE wells SVE-38 through SVE-41 to the previously existing “red line” near SVE-5 was bedded with approximately three inches of sand below and six inches of sand above the pipe. The remaining portion of the piping excavations and the well vault excavations were backfilled with flowable fill to a depth of approximately 4 inches bgs. A 4-inch layer of asphalt was then placed to match the existing pavement.

Excavated soils were placed in labeled and covered roll-off boxes and managed by URS on behalf of SOPUS. P66 personnel coordinated the transportation and disposal of the solid waste at a properly licensed disposal facility.

Aboveground piping was installed to SVE-37 and tied into the previously existing “red line” between SVE-5 and SVE-6. A stainless steel aboveground well enclosure was installed at SVE-37.

Prior to backfilling, successful non-destructive evaluation (NDE) and hydrostatic testing of field welds was completed between September 30, 2013 and October 7, 2013. On October 11, 2013, all new piping to SVE-38 through SVE-41 was successfully pneumatically tested with nitrogen. No leaks were detected at any of the flanged connections during the test. Quality Assurance/Quality Control (QA/QC) field test results can be found in **Appendix E**. NDE and hydrostatic test results for shop-fabricated pipe are also provided in **Appendix E**.

Gross completed construction activities on October 22, 2013 with the completion of asphalt placement, painting of parking stall stripes, and removal of construction fencing and barriers. URS began commissioning of the SVE System Extension on October 23, 2013, with all SVE System Extension wells online by November 7, 2013.

Plan views of the System are included in **Figures 2** and **2A**. A detailed as-built drawing is included in **Appendix F**.

URS personnel provided oversight during the construction and installation of the SVE System Extension to monitor, document, and assure construction activities and performance met the intent of the design specifications. Oversight activities included layout, documentation of installation, and observation of field construction activities. Additionally, the on-site URS representatives monitored compliance of the contractor with their QA/QC plans.

QA/QC documentation provided by Gross is presented in **Appendix E**.

Daily on-site construction observation was performed by URS field representatives and Gross' on-site QA/QC representatives. The construction and installation activities performed by URS' contractors for the SVE System Extension were in general conformance with the conceptual design drawings.

Photographs of construction activities are included in **Appendix G**.

Laboratory Qualifiers

< "U" = Not detected at the reporting limit.

J = The analyte was detected below the reporting limit. Result is estimated.

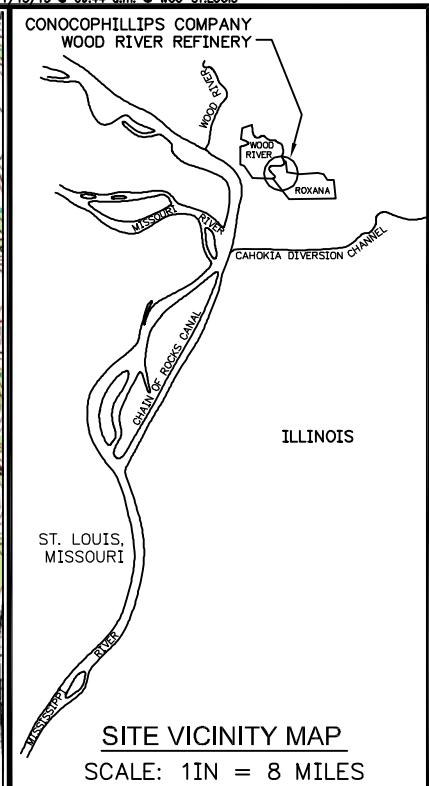

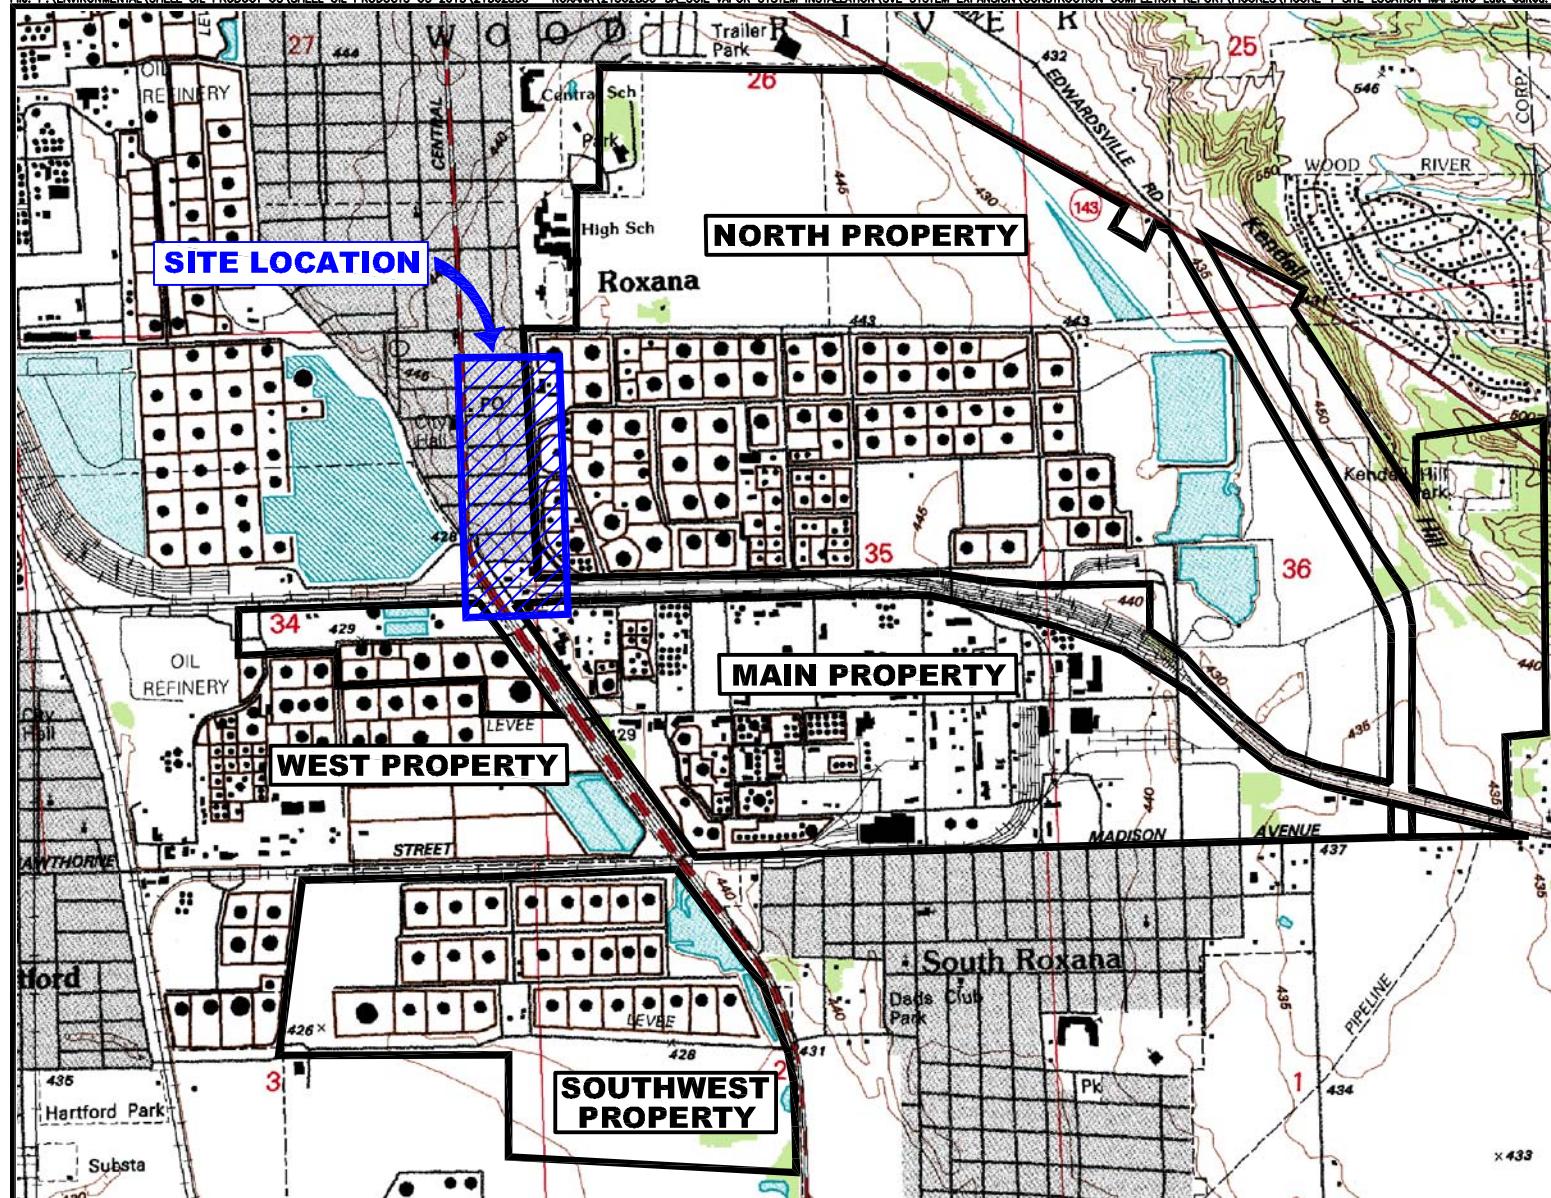

JN = Estimated value for tentatively identified compound (TICs). (library search)

Note: Library searches for TICs are used to look for the presence of non-target analytes.

TICs reported are those present at levels above ten percent of associated internal standard responses.

URS Qualifiers

J = The result is estimated.

Data Review Sheets and Laboratory Analytical Reports

Roxana SVE Extension 2013 Data Review

Laboratory SDG: MC24449

Data Reviewer: Melissa Mansker

Peer Reviewer: Elizabeth Kunkel

Date Reviewed: 10/14/2013

Guidance: USEPA National Functional Guidelines for Superfund Organic Methods Data Review 2008

Sample Identification	Sample Identification
TB-091613-ST	TB-091613-HCL
SVE-38-091613 (34-36')	SVE-38-091613 (34-36')-Dup

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Yes, the laboratory case narrative indicated VOC and SVOC LCS recoveries and VOC RPDs were outside evaluation criteria. The difference in results for several analytes in the field duplicate pair SVE-38-091613 (34-36')/SVE-38-091613 (34-36')-Dup was greater than five times (5X) the reporting level; therefore, results were qualified as estimated. These issues are addressed further in the appropriate sections below.

The cooler receipt form indicated samples were received by the laboratory at 1.8°C which is outside temperature criteria 4°C ± 2°C. All samples were received in good condition; no qualification of data was required.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

No

LCS/ LCSD ID	Parameter	Analyte	LCS/ LCSD Recovery	RPD	LCS/LCSD /RPD Criteria
MSM2067-BS	VOCs	Acrolein	52	NA	70-130
MSM2067-BS	VOCs	1,2,3-Trichlorobenzene	132	NA	70-130

LCS/ LCSD ID	Parameter	Analyte	LCS/ LCSD Recovery	RPD	LCS/LCSD /RPD Criteria
MSM2067-BS	VOCs	1,2,4-Trichlorobenzene	143	NA	70-130
MSV901- BS/BSD	VOCs	Acetone	73/95	26	70-130
OP34955-BS	SVOCs	Hexachlorocyclopentadiene	35	NA	40-140

Analytical data that required qualification based on LCS data are included in the table below. Analytical data reported as non-detect and associated with LCS recoveries above evaluation criteria, indicating a possible high bias, did not require qualification. LCS/LCSD MSV901-BS/BSD was associated with the trip blank; trip blanks are quality control samples and do not require qualification.

Sample ID	Parameter	Analyte	Qualification
SVE-38-091613 (34-36')	VOCs	Acrolein	UJ
SVE-38-091613 (34-36')-Dup	VOCs	Acrolein	UJ
SVE-38-091613 (34-36')	SVOCs	Hexachlorocyclopentadiene	UJ
SVE-38-091613 (34-36')-Dup	SVOCs	Hexachlorocyclopentadiene	UJ

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Yes

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

No

8.0 Internal Standard (IS) Recoveries

Were internal standard area recoveries within evaluation criteria?

Yes

9.0 Laboratory Duplicate Results

Were laboratory duplicate samples collected as part of this SDG?

No

10.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

Yes

Field ID	Field Duplicate ID
SVE-38-091613 (34-36')	SVE-38-091613 (34-36')-Dup

Were field duplicates within evaluation criteria?

Roxana SVE Extension 2013 Data Review

Laboratory SDG: MC24503

Data Reviewer: Melissa Mansker

Peer Reviewer: Elizabeth Kunkel

Date Reviewed: 10/15/2013

Guidance: USEPA National Functional Guidelines for Superfund Organic Methods Data Review 2008

Sample Identification	Sample Identification
TB-091713-ST	TB-091713-HCL
SVE-39-091713 (34-36')	

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Yes, the laboratory case narrative indicated VOC and SVOC LCS recoveries were outside evaluation criteria. VOC MS/MSD recoveries were outside of evaluation criteria in sample SVE-39-091713 (34-36'). The internal standard area recovery for tert butyl alcohol-d₉ in matrix spike duplicate SVE-39-091713 (34-36') MSD was outside evaluation criteria. These issues are addressed further in the appropriate sections below.

The cooler receipt form indicated samples were received by the laboratory at 1.0°C which is outside temperature criteria 4°C ± 2°C. All samples were received in good condition; no qualification of data was required.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

No

LCS ID	Parameter	Analyte	LCS Recovery	RPD	LCS Criteria
MSM2071-BS	VOCs	Acrolein	52	NA	70-130
MSM2071-BS	VOCs	2-Butanone (MEK)	135	NA	70-130

LCS ID	Parameter	Analyte	LCS Recovery	RPD	LCS Criteria
MSM2071-BS	VOCs	Vinyl acetate	56	NA	70-130
OP34955-BS	SVOCs	Hexachlorocyclopentadiene	35	NA	40-140

Analytical data that required qualification based on LCS data are included in the table below. Analytical data reported as non-detect and associated with LCS recoveries above evaluation criteria, indicating a possible high bias, did not require qualification.

Sample ID	Parameter	Analyte	Qualification
SVE-39-091713 (34-36')	VOCs	Acrolein	UJ
SVE-39-091713 (34-36')	VOCs	Vinyl acetate	UJ
SVE-39-091713 (34-36')	SVOCs	Hexachlorocyclopentadiene	UJ

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Yes

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

Yes, although not requested, sample SVE-39-091713 (34-36') was spiked and analyzed for VOCs.

Were MS/MSD recoveries within evaluation criteria?

No

MS/MSD ID	Parameter	Analyte	MS/MSD Recovery	RPD	MS/MSD RPD Criteria
SVE-39-091713 (34-36')	VOCs	Acetone	112/141	22	70-130/30

SVE-39-091713 (34-36')	VOCs	1,4-Dioxane	99/132	28	70-130/30
SVE-39-091713 (34-36')	VOCs	Hexachlorobutadiene	62/72	15	70-130/30
SVE-39-091713 (34-36')	VOCs	Naphthalene	63/74	16	70-130/30
SVE-39-091713 (34-36')	VOCs	1,2,3-Trichlorobenzene	51/62	19	70-130/30
SVE-39-091713 (34-36')	VOCs	1,2,4-Trichlorobenzene	58/68	15	70-130/30

MS/MSD ID	Parameter	Analyte	MS/MSD Recovery	RPD	MS/MSD/ RPD Criteria
SVE-39-091713 (34-36')	VOCs	Vinyl acetate	53/63	16	70-130/30

USEPA National Functional Guidelines for Organic Data Review indicates that organic data does not require qualification based on MS/MSD data alone and LCS recoveries were within evaluation criteria with the exception of compounds listed and qualified as appropriate in Section 5.0 of this data review. No further qualification of the data was required.

8.0 Internal Standard (IS) Recoveries

Were internal standard area recoveries within evaluation criteria?

No

Sample ID	Parameter	Analyte	IS Area Recovery	IS Criteria
SVE-39-091713 (34-36') MSD	VOCs	Tert butyl alcohol-d ₉	187305	41284-165134

Matrix spike duplicate SVE-39-091713 (34-36') is a quality control sample and is not qualified; no qualification of data was required.

9.0 Laboratory Duplicate Results

Were laboratory duplicate samples collected as part of this SDG?

No

10.0 Field Duplicate Results

Were field duplicate samples collected as part of this SDG?

No

11.0 Sample Dilutions

For samples that were diluted and nondetect, were undiluted results also reported?

Not applicable; samples analyzed did not require dilution.

12.0 Additional Qualifications

Were additional qualifications applied?

No

SVE-40-091813 (30-32')	

1.0 Data Package Completeness

Were all items delivered as specified in the QAPP and COC as appropriate?

Yes

2.0 Laboratory Case Narrative \ Cooler Receipt Form

Were problems noted in the laboratory case narrative or cooler receipt form?

Yes, the laboratory case narrative indicated VOC and SVOC LCS recoveries were outside evaluation criteria. SVOC MS/MSD recoveries were outside of evaluation criteria in sample SVE-40-091813 (30-32'). These issues are addressed further in the appropriate sections below.

The cooler receipt form indicated samples were received by the laboratory at 1.8°C which is outside temperature criteria 4°C ± 2°C. All samples were received in good condition; no qualification of data was required.

3.0 Holding Times

Were samples extracted/analyzed within applicable limits?

Yes

4.0 Blank Contamination

Were any analytes detected in the Method Blanks, Field Blanks or Trip Blanks?

No

5.0 Laboratory Control Sample

Were LCS recoveries within evaluation criteria?

No

Analytical data that required qualification based on LCS data are included in the table below. Analytical data reported as non-detect and associated with LCS recoveries above evaluation criteria, indicating a possible high bias, did not require qualification.

Sample ID	Parameter	Analyte	Qualification

6.0 Surrogate Recoveries

Were surrogate recoveries within evaluation criteria?

Yes

7.0 Matrix Spike and Matrix Spike Duplicate Recoveries

Were MS/MSD samples analyzed as part of this SDG?

Yes, although not requested, sample SVE-40-091813 (30-32') was spiked and analyzed for SVOCs.

Were MS/MSD recoveries within evaluation criteria?

No

MS/MSD ID	Parameter	Analyte	MS/MSD Recovery	RPD	MS/MSD/ RPD Criteria

Procedure for Holiday Testing (Spark Testing) of FBE Coatings and Trenton #2 Wax Tape Coatings.

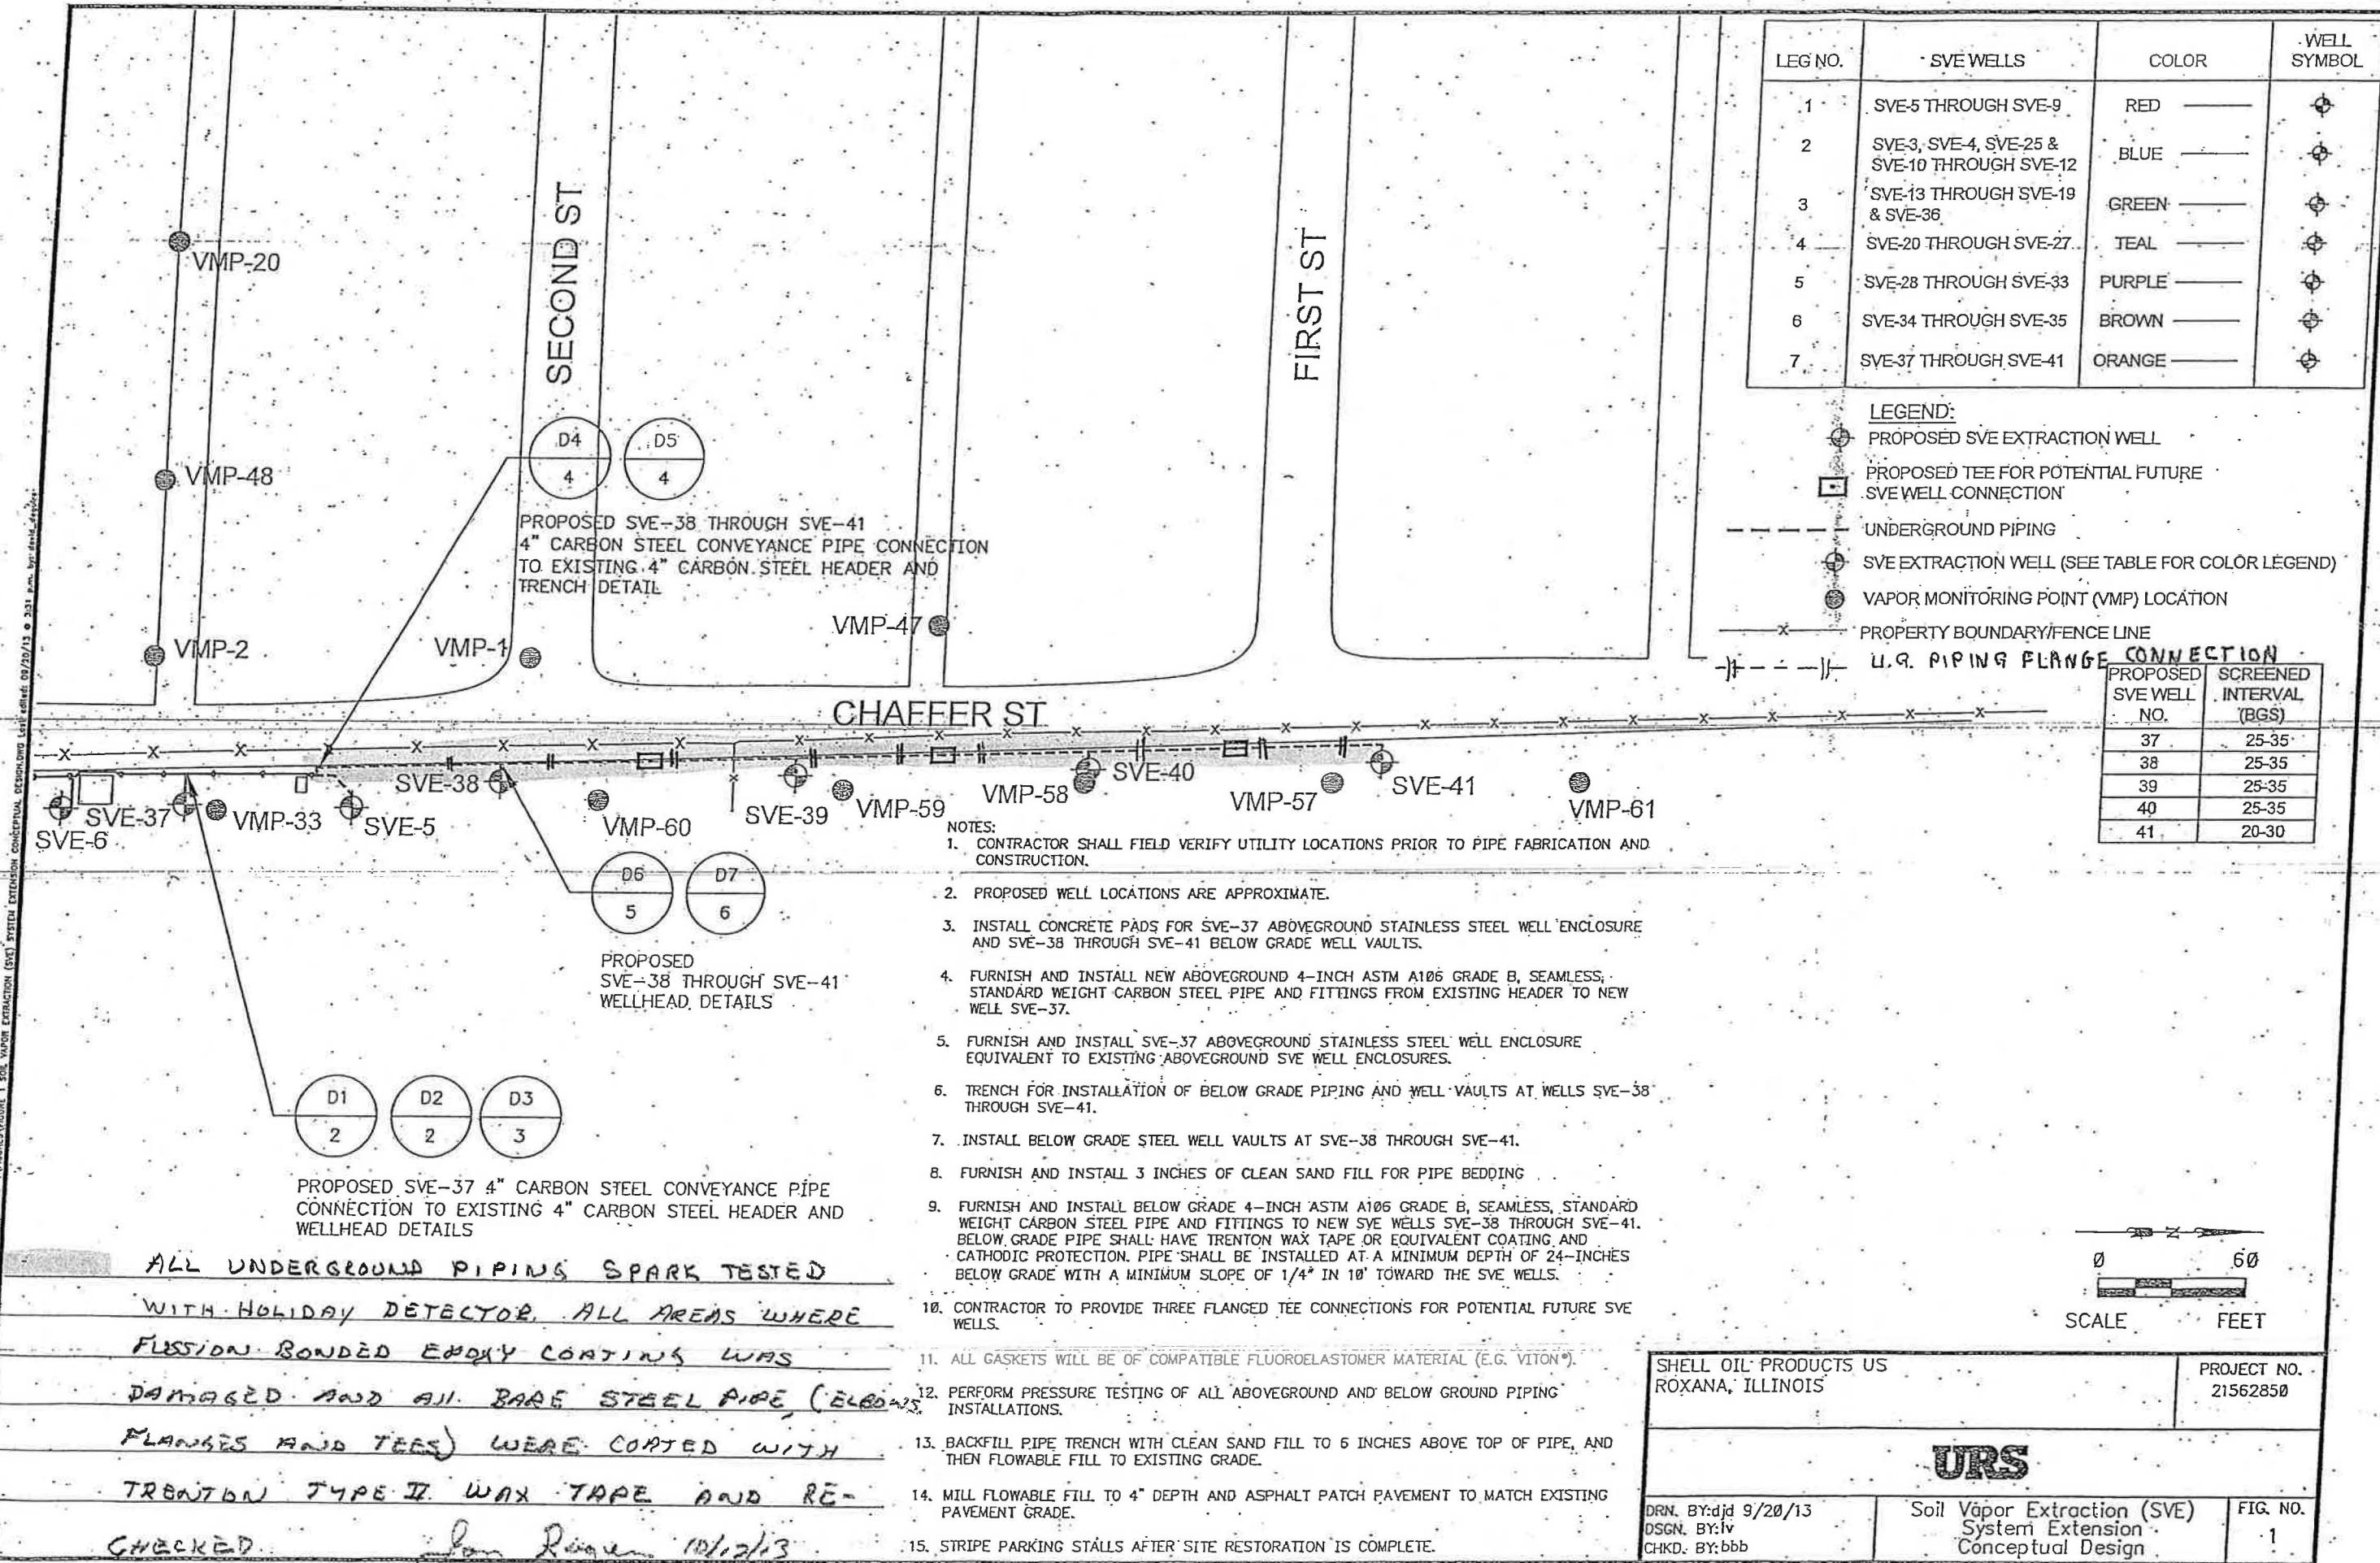

Fusion Bonded Epoxy Coatings – Field Testing

- 1) Visual Examination of the coatings. Visually examine the FBE coated piping system identifying any scratched, mars or other surface damaged areas. Measure the thickness of the FBE coating. Generally, the coating should be 14 to 16 mills.
 - 2) Holiday Testing of FBE coated pipe. The voltage shall be set at 125 VDC per mill thickness of the coating. Minimum voltage setting should be 2000V.
 - 3) Failures detected during visual examination or thickness readings should be repaired by patch compound for small areas or stripped and recoated for large areas. Failures detected during Holiday Testing should be repaired similar as noted or may have addition corrosion protection applied to the defective area. This included application of Trenton #2 Wax Tape and primer.
-

Trenton #2 Wax Tape with Trenton Wax Tape Primer – Field Testing

- 1) Visual examination. Prior to application of Wax Tape Primer, the pipe surface shall be cleaned to remove all dirt and loose rust/scale, etc.
 - 2) Apply Trenton Wax Tape Primer (brown) to the pipe/fitting by hand. Do not apply primer too thick and do not apply primer to top of wax tape.
 - 3) Apply Trenton #2 Wax Tape. Use clean gloves when applying the wax tape to pipe/fittings. Avoid additional application of primer to wax tape. Overlap the wax tape by a minimum of 1 inch covering the pipe and fittings 100%.
 - 4) Visually examine the wax tape coated pipe/fittings for complete coverage.
 - 5) Holiday test the wax tape at Manufacturers recommended voltage settings of 5000V.
 - 6) Repair any areas where holiday testing shows failure and retest.
-

Document holiday testing on GMC's "Coating of Steel Pipe and Fittings with Trenton Wax Tape" form.
