Mr. Steven F. Nightingale, P.E.
Manager, Permit Section
Illinois Environmental Protection Agency
Bureau of Land
1021 North Grand Avenue East
Springfield, Illinois 62794

Subject: **Soil Vapor Sampling and SVE Monitoring Report – 2nd Quarter 2013**
Roxana, Illinois
1191150002 – Madison County
Equilon Enterprises LLC d/b/a Shell Oil Products US
Log No. B-43R

Dear Mr. Nightingale:

On behalf of Shell Oil Products US, URS Corporation is submitting the enclosed report for your review. This report includes information required by Condition 3 of Illinois Environmental Protection Agency's (IEPA) letter dated August 5, 2010, and Condition 13 of IEPA's letter dated September 13, 2012.

If you have any questions during your review, please contact Kevin Dyer, SOPUS Principal Program Manager, at kevin.dyer@shell.com (618/288-7237), or me at robert.mooshegian@urs.com (314/743-4106).

Sincerely,
URS Corporation, on behalf of Shell Oil Products US

Michael Currier
Environmental Scientist

Robert Mooshegian, CHMM
Senior Project Manager

Enclosures: RCRA Corrective Action Certification and Report (original plus 2 copies)

ILLINOIS EPA RCRA CORRECTIVE ACTION CERTIFICATION

This certification must accompany any document submitted to Illinois EPA in accordance with the corrective action requirements set forth in a facility's RCRA permit. The original and two copies of all documents submitted must be provided.

1.0 FACILITY IDENTIFICATION

Name: Equilon Enterprises LLC d/b/a Shell Oil Products US

County: Madison

Street Address: 900 South Central Ave.

Site No. (IEPA): 1191150002

City: Roxana, IL 62084

Site No. (USEPA): ILD 080 012 305

2.0 OWNER INFORMATION

Name: Not Applicable

4.0 TYPE OF SUBMISSION (check applicable item and provide requested information, as applicable)

☐ RFI Phase I Workplan/Report
☐ RFI Phase II Workplan/Report
☐ CMP Report; Phase
☒ Other (describe):
Soil Vapor Sampling and SVE Monitoring Report – 2nd Quarter 2013
Date of Submittal 7-30-13

IEPA Permit Log No. B-43R
Date of Last IEPA Letter on Project 6/21/13
Log No. of Last IEPA Letter on Project B-43R-CA-50
Does this submittal include groundwater information: ☒ Yes ☐ No

5.0 DESCRIPTION OF SUBMITTAL: (briefly describe what is being submitted and its purpose)

Soil Vapor Sampling and SVE Monitoring report for the 2nd Quarter 2013 in the project area located in the Village of Roxana.

6.0 DOCUMENTS SUBMITTED (identify all documents in submittal, including cover letter; give dates of all documents)

Cover letter, RCRA Corrective Action Certification and Soil Vapor Sampling and SVE Monitoring Report – 2nd Quarter 2013

7.0 CERTIFICATION STATEMENT - ***(This statement is part of the overall certification being provided by the owner/operator, professional and laboratory in Items 7.1, 7.2 and 7.3 below)***. The activities described in the subject submittals have been carried out in accordance with procedures approved by Illinois EPA. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

7.1 **OWNER/OPERATOR CERTIFICATION** (Must be completed for all submittals. Certification and signature requirements are set forth in 35 IAC 702.126.) All submittals pertaining to the corrective action requirements set forth in a RCRA Permit must be signed by the person designated below (or by a duly authorized representative of that person):

1. For a Corporation, by a principal executive officer of at least the level of vice-president.
2. For a Partnership or Sole Proprietorship, by a general partner or the proprietor, respectively.
3. For a Governmental Entity, by either a principal executive officer or a ranking elected official.

A person is a duly authorized representative only if:

1. the authorization is made in writing by a person described above; and
2. the written authorization is provided with this submittal (a copy of a previously submitted authorization can be used).

Owner Signature: _____ _____ (Date)

Title: _____

Operator Signature: Kevin E Adgate 7/23/13 (Date)

Title: Principal Program Manager

7.2 **PROFESSIONAL CERTIFICATION** ***(if necessary)*** - Work carried out in this submittal or the regulations may also be subject to other laws governing professional services, such as the Illinois Professional Land Surveyor Act of 1989, the Professional Engineering Practice Act of 1989, the Professional Geologist Licensing Act, and the Structural Engineering Licensing Act of 1989. No one is relieved from compliance with these laws and the regulations adopted pursuant to these laws. All work that falls within the scope and definitions of these laws must be performed in compliance with them. The Illinois EPA may refer any discovered violation of these laws to the appropriate regulating authority.

Professional's Signature: Robert B Billman

Shell Oil Products US (SOPUS) has been conducting a subsurface investigation in the Village of Roxana in the area generally bounded by the alley north of East First Street, the Roxana Public Works Yard, Illinois Route 111 and the property boundary (a/k/a West Fenceline) of the WRB Refining, LP (WRB)[1] Wood River Refinery (WRR) (**Figure 1**). Additional investigation has been conducted inside the WRR; this work was conducted in cooperation with WRB/Phillips 66 (P66)[2]. For the purposes of presentation in this report only, the combined area is collectively referred to as the "Investigation Area." The Investigation Area includes a portion of a residential area in the Village of Roxana, Roxana Public Works Yard, and the adjoining portions of the WRR. For the purposes of this report, the term "Village" is used to denote the residential area generally bounded by the alley north of East 1st Street (north), 8th Street (south), Chaffer Street (east) and Illinois Route 111 (South Central Avenue) (west).

SOPUS has been investigating and delineating soil vapor in the Investigation Area through the installation, development, and sampling of vapor monitoring ports (VMPs). Vapor monitoring locations (VMP-1 through VMP-16) were installed based on a work plan submitted to the Illinois Environmental Protection Agency (IEPA) on behalf of SOPUS on January 21, 2009. IEPA approved the work plan with conditions on May 12, 2009 (IEPA, 2009). The results of the vapor investigation and delineation efforts were presented in the *Dissolved Phase Groundwater Investigation and P-60 Free Phase Product Delineation Report*, dated February 18, 2010 (URS, 2010a). Based on recommendations contained in that report, an additional four vapor monitoring ports were installed, developed, and sampled at one existing (VMP-3) and three new vapor monitoring locations (VMP-17 through VMP-19) in the Spring/Summer 2010, with results presented in the *Addendum to February 2010 Report – Supplemental Investigation Activities*, dated September 20, 2010 (URS, 2010b).

IEPA provided comments to the February 18, 2010 report in a letter to SOPUS dated August 5, 2010 (IEPA, 2010). In particular, Comment Number 3 required quarterly soil vapor sampling and reporting, and Comment Number 2 described the need to further delineate the extent of soil vapors beneath the area. Six VMPs (VMP-20 through VMP-25) were installed and added to the quarterly sampling program beginning with 1st Quarter 2011 (1Q11).

IEPA provided further comments in a March 16, 2011 letter (IEPA, 2011) to SOPUS approving the *Soil Vapor Extraction (SVE) Pilot Test Workplan*. In particular, Comment Number 2

[1] WRB, formed January 1, 2007, is a 50/50 joint venture between ConocoPhillips (COP) and EnCana US Refineries, LLC (now known as Cenovus Energy, Inc.).

[2] ConocoPhillips Company announced the separation of the Refining and Marketing business from the Exploration & Production business on July 14, 2011. The separation included an ownership change as well as a name change that became effective May 1, 2012. Phillips 66 is now the operator of the WRB WRR.

required that quarterly soil vapor sampling continue at the 25 VMP locations, and Comment Number 9 requested an updated report, including a discussion of the geology, extent of groundwater impact, and distribution of impacted soil vapor. These items/comments were included in the 1Q11 Soil Vapor Report (URS, 2011a), and have been updated for this report.

As a result of a meeting between SOPUS and the IEPA on February 8, 2012, the quarterly soil vapor sampling program was expanded to include six additional soil VMPs (VMP-31, VMP-32, and VMP-42 through VMP-45). VMP-31 and VMP-32 were installed in 2nd Quarter 2011 (2Q11) to monitor soil vapor during operation of the Internal Combustion Engines (ICE) located near 4th and Chaffer Street. VMP-42 through VMP-45 were installed during the 3rd Quarter 2011 (3Q11) and 4th Quarter 2011 (4Q11) in conjunction with the SVE System installation to monitor soil vapor concentrations. Monitoring of these VMPs commenced with the 2nd Quarter 2012 (2Q12) sampling event.

Based on the September 13, 2012 letter (IEPA, 2012), VMP-29, VMP-30, and VMP-41 located within the Roxana Public Works yard were added to the quarterly sampling program during 3Q12. Additional VMPs (VMP-47 through VMP-55) were installed during the 4th Quarter 2012 (4Q12) in the Village. Monitoring of these VMPs commenced in the 1st Quarter 2013 (1Q13) sampling event. The locations of these VMPs in the soil vapor sampling network are presented on **Figure 2**.

In the September 13, 2012 letter, IEPA also requested development of a quarterly report documenting the results of monitoring and remedial efforts associated with operating the SVE system. These results have been added to the subject report.

This section summarizes the current understanding of the Investigation Area geology and hydrogeology.

2.1 GEOLOGY

The Investigation Area is located approximately 1.5 miles east of the Mississippi River within the American Bottoms floodplain. The surface topography is generally flat; however it slopes downward to the west-southwest in the southwestern portion of the Village, with a total drop in elevation of approximately 15 feet across the area.

The ground surface in the Village within the Investigation Area, where not developed with structures, is primarily grass covered with paved (i.e. chip and seal, asphalt, etc.) alleys and streets. Beneath any man-made fill material, the subsurface conditions generally consist of silty clay underlain by sands to the depths investigated.

Subsurface stratigraphy within the Investigation Area generally consists of the following materials, from the ground surface down:

- Fill - (mainly clay, some gravel and cinders, etc.) Extends from the surface to approximately six feet below ground surface (bgs).
- Clay/Silt - Primarily silty clay. Where present, the clay generally extends from the base of the fill to approximately 12 feet bgs.
- Sand - Consisting primarily of fine to medium grained (which coarsens with depth) sand with some silt and clay, especially at the shallower depths. The sand begins at the base of the clay (or base of the fill if the clay is not present) and extends to the total depth of the borings.

Discontinuous lower permeability lenses of clay with some silt and sand are occasionally present. These lenses vary in thickness from 1 inch to a few feet and do not appear to be laterally (or vertically) extensive.

Cross-sections depicting the underlying geology were previously presented in the *Dissolved Phase Groundwater Investigation and P-60 Free Phase Product Delineation Report*, dated February 18, 2010 (URS, 2010a). These cross-sections were developed based on information provided on cone penetration test (CPT) logs and soil boring logs. A modified cross-section presenting analytical data is discussed in **Section 4.3** of this report.

2.2 HYDROGEOLOGY

Groundwater in the sand underlying the Investigation Area is the primary source for large volume water production in the area (e.g., industrial and municipal supply). Prior to

development in the area, the natural movement of groundwater was toward the west (toward the Mississippi River). Since development in the area, groundwater pumping has altered the groundwater flow in the area to flow toward nearby pumping wells (e.g. WRR, BP, etc.).

The water table encountered during 2Q13 was at a depth of approximately 29 to 48 feet bgs (approximate elevation 399 to 401 feet above sea level). The variation in depth of groundwater from the ground surface is partially due to a change in surface elevation across the study area. As a result, there is generally a 15 to 30 foot thick vadose (unsaturated) zone in the sand. Groundwater gauging data from 2Q13 indicates that the groundwater has dropped up to 0.5 to 1 foot along the WRR West Fenceline since 1Q13. Water level measurements collected during the 2Q13 groundwater gauging event and historical water level measurements collected over the past three years are provided in **Table 1**. Depth to product (if present) and depth to water were noted in electronic format using Panasonic Toughbook® technology (Toughbook®) and on groundwater field gauging sheets.

There are discontinuous low permeability clay lenses above the water table (approximately 20 feet bgs) mixed with silt and sand. These clay lenses are isolated and limited in occurrence. There are additional discontinuous clay lenses at a depth of approximately 40 to 45 feet bgs localized in the area of East 3rd Street and Chaffer Street. These may be above or below the water table depending on groundwater conditions. As a result, the groundwater contours displayed on **Figure 3** show a slight mounding in this area.

The potentiometric surface observed during the 2Q13 comprehensive groundwater monitoring well gauging[3] (**Figure 3**) illustrates groundwater flow within the Village and WRR. **Figure 4** provides the groundwater potentiometric surface for the Investigation Area in 2Q13.

[3] 2Q13 groundwater gauging performed April1-3, 2013.

The 2Q13 soil vapor sampling event was performed in accordance with applicable URS site-specific Standard Operating Procedures (SOPs) that incorporate previous IEPA comments, conditions, and/or modifications. The 2Q13 VMP sampling event was conducted April 15 through May 16, June 4 through 6, and July 11, 2013.

3.1 VAPOR MONITORING PORT SAMPLING

The soil vapor sampling network currently consists of 55 VMP locations (**Figure 2**), of which 43 locations are currently being utilized for quarterly sampling. VMPs are generally screened at four depths[4] at each location. The individual VMPs are labeled and color-coded in the field from shallow to deep by using the color scheme of yellow (first interval), blue (second interval), green (third interval), and red (fourth interval). Additional VMPs installed as part of a supplemental sampling event in 2nd Quarter 2010 (2Q10) are color-coded white (10-foot depth). Vapor ports installed during 3Q11 and 4Q11 do not have the shallow (5-foot depth) port included, and begin with the blue interval port. Soil VMP depths are provided in **Table 2**.

VMP Sampling

VMP sampling activities were attempted at each designated location within the Investigation Area. The sampling was performed in accordance with SOP No. 44R4 – Soil Vapor Purging and Sampling and ASTM D-7663-12.

Prior to VMP sampling, an initial stainless-steel canister vacuum check was performed. A designated pressure gauge provided by the laboratory was attached to the stainless-steel canister inlet, and the stainless-steel canister valve was opened completely. The pressure gauge reading was recorded as "Initial Vacuum Reading" on the stainless-steel canister tag and the field form. This ensured that the canister showed a vacuum of approximately 26 to 30 inches of mercury (Hg). If the canister displayed an initial vacuum of less than 26 inches of Hg, the canister was set aside and returned to the laboratory.

In addition, each flow controller was subjected to an isolated vacuum check to ensure that connectors did not leak. This was conducted by attaching a plug to one end of the flow controller and a barbed connector to the other. A 15 mL hand pump with a vacuum gauge was then attached to the barb. The hand pump evacuated the air inside the flow controller until a vacuum of at least 10 inches Hg was achieved. If the vacuum change over five minutes was equal to or less than 0.5 inches of Hg, the controller was considered acceptable for sampling use.

The following steps were used to collect each VMP sample:

[4] With the exception of single shallow ports at VMP-17, 18, 19, three ports at VMP 41 through VMP 45, and five ports at VMP-3.

- Upon arrival at a sampling location, the sampling crew would open the vapor port vault to visually check integrity of each individual soil VMP. This included checking that each port was closed with either a Swagelok® stainless-steel reducer and plug or a 4-way stopcock in place, and each VMP was properly labeled to identify the proper depth.
- The sample train was set up as shown in the photo below. After removing the stainless steel reducer or 4-way stopcock, a hose barb connector on the sample train was connected directly to the monitoring port using compression ferrule connections. A flow controller, provided by the laboratory, was then connected to the stainless-steel canister inlet. Flow controllers were not reused during the sampling event. Each flow controller is pre-set by the laboratory to collect the sample over a half-hour period. For a 1-Liter stainless-steel canister, one half-hour is a standard collection time (~28 ml/min). Once the sample train was assembled, a vacuum leak check was performed in accordance with SOP No. 44R4 – Soil Vapor Purging and Sampling.
- An enclosure was then placed over the VMP and assembled sample train as shown in the photo below. The enclosure has openings for:
  - The introduction of tracer gas (i.e., helium);
  - Pressure relief to the atmosphere and access for a tracer gas monitoring device;
  - Tygon® tubing to connect to the peristaltic pump for Valve #1 (out) and Valve #2 (out and in).

- The enclosure has sufficient glove access to open or close all valves within. The enclosure was sealed to the ground at each location with a hydrated bentonite seal.
- Helium gas was introduced into the enclosure until the atmosphere reached a concentration of approximately 50% Helium; the regulator on the helium tank was manually controlled to maintain that range.
- Three well volumes were purged from each VMP prior to sampling using a 15 mL hand pump[5]. If the pump gauge held a vacuum, the VMP was presumed to be saturated with water and no sample was collected. VMP water saturation was compared against the groundwater measurements from the initial gauging event for confirmation.
- After purging was completed a Tedlar bag sample was collected using a peristaltic pump. A Dielectric Technologies MGD-2002 field analyzer was then used to detect possible helium within the Tedlar bag sample. This check verifies the vacuum check for the sample train and integrity of the sample port. If the helium reading was $\geq$10% concentration of the helium in the enclosure, the Tedlar bag sample was additionally analyzed using a Landtec landfill gas detector to obtain a direct methane reading. The presence of methane can cause a false positive helium reading on the MGD-2002 field analyzer.
- Once the initial helium leak check was completed, the stainless-steel canister valve was opened to collect a sample for approximately 30 minutes or until a vacuum gauge reading of 5 inches Hg was observed. After sample completion, the stainless-steel canister valve was closed (isolating it from the sample train) and soil vapor was bypassed to the second Tedlar bag sample.
- A second Tedlar bag was filled following the completion of the stainless-steel canister sampling. Soil vapor readings were taken from the Tedlar bag sample for total volatile organics with a photoionization detector (PID) and a Thermo Scientific TVA 1000 Vapor Analyzer - Flame Ionization Detector (FID); and for carbon dioxide ($CO_{2)}$, methane (CH_4), lower explosive limit (LEL), and oxygen (O_2) with a Landtec GEM 2000 landfill gas meter. Readings were also obtained and recorded for helium with a MGD-2002 field analyzer. This check was used to verify the sample train integrity during and at the completion of sampling.

[5] The purge volume was calculated using the following assumptions: vapor port tubing (1/8-in diameter): 2.41 ml/foot (single volume) and sample train assembly (1/4-in diameter): 9.65 mL/foot (single volume).

- At the completion of sampling, the stainless-steel canister and flow controller were removed and separated from the sample train and a final vacuum reading was taken with a designated pressure gauge provided by the laboratory. The stainless-steel canisters were then maintained in a safe location to minimize temperature change and protect from damage prior to shipping.
- At the completion of sampling, either the VMP plug was reinstalled or the 4-way stopcock was closed to maintain port integrity.
- Field data pertaining to canister identification data (ID), start and finish time, initial and final vacuum readings, purge volumes, and leak checks for each VMP was recorded electronically using a touchpad in a Soil Vapor Sampling – Canister Sampling Data database. Data from portable field analyzers, such as, a PID, a FID, a landfill gas meter, and a helium gas detector were recorded electronically in the field by using a Toughbook.
- Field duplicates were collected by including an additional T-connection in the sample train and attaching a second stainless-steel canister with a separate flow controller. Both the original and duplicate samples were started at the same time.

Field measurements from this event and previous three years of consecutive quarterly events are presented on **Table 3.**

Additional Notes on VMP Sampling

Saturated VMP Screens **-** The groundwater monitoring well gauging results indicated that some of the VMP screens were submerged beneath the water table during 2Q13. However, purging was attempted at each of the ports with a 15 mL hand pump to verify the VMP screens were submerged.

A total of five 4th interval VMPs held a vacuum or produced water when purged with a 15 mL hand pump indicating the VMPs were most likely submerged beneath the water table. Three of the five VMPs are located in the Public Works Yard. One 1st interval VMP, two 2nd interval VMPs, and one 3rd interval VMP were also found to be submerged. Three of the nine submerged screens were present at VMP-55, which was sampled for the first time in 1Q13. Three attempts were made to develop VMP-55-5, VMP-55-10, and VMP-55-30; however, all ports remained submerged after each development attempt. All three ports remained submerged during the 2Q13 sampling event. VMPs that were submerged and could not be sampled during 2Q13 are identified on **Figures 5 and 6**.

Resamples **–** VMP-24-5 and VMP-49-20 were resampled on May 1, 2013 and May 9, 2013, respectively, after the samples collected yielded a final vacuum of zero (0) inches of Hg on field

pressure gauges. All four ports at VMP-53 were resampled on July 11, 2013 after review of the results at VMP-53-10 indicated an anomaly when compared to prior results from the location. All field screening data collected at this location were consistent with the data collected during the July 11, 2013 resample. Data from the resample appears more representative and was used for certain figures in this report. The field data for these samples are provided on **Table 3**.

Helium Leaks – Ten VMPs failed to pass the helium leak check in the field when sampling was initially attempted. Sampling was reattempted at these VMP locations: VMP-6-5, VMP-6-10, VMP-8-23.5, VMP-11-8, VMP-31-10, VMP-31-20, VMP-43-10, VMP-44-30, VMP-45-10, and VMP-48-10. Valid samples were obtained, except for VMP-6-5 and VMP-31-20 due to three consecutive helium leak check failures in the field. The field data for these samples are provided on **Table 3**.

Re-installation – Two VMP locations had sampling ports re-installed in 2Q13 due to the apparent loss of integrity in the VMP tubing. VMP-3-5 was replaced on May 29, 2013. VMP-3-10 was also replaced due to VMP-3-5 being re-installed in the sampling vault for VMP-3-10. All four sampling ports at VMP-7 were re-installed on May 30, 2013.

3.2 HEALTH & SAFETY, DECONTAMINATION, AND INVESTIGATION DERIVED WASTE

Health & Safety

The quarterly sampling activities were performed and governed by the *Roxana / Route 111, WRR, and Rand Avenue Investigation and Remediation Health and Safety Plan,* dated April 2013 (URS, 2013a), as prepared by URS.

Prior to beginning site work and at the start of work each day, a daily safety meeting was held. The purpose of this meeting was to discuss the day's planned activities and to address any potential health and safety concerns. As a part of the daily safety meeting, job safety analyses (JSAs) were reviewed to address task specific safety concerns.

URS field personnel primarily wore U.S. Environmental Protection Agency (USEPA) modified Level D personal protective equipment (PPE), which included hard hat, steel-toed boots, safety glasses, etc. In addition, work within the WRR was performed wearing flame retardant clothing (FRCs) per WRR requirements (in areas where required).

A PID with a 10.6 electron volt (eV) probe, combustible gas indicator (CGI), UltraRAE with benzene specific measuring tubes, and individual hydrogen sulfide gas detectors (for locations inside WRR) were used as needed during the field activities to monitor air quality. Field instruments were calibrated prior to use each day in accordance with the manufacturer's specifications.

Decontamination

Field personnel and equipment underwent decontamination procedures to ensure the health and safety of those present, to maintain sample integrity, and to minimize cross-contamination. Non-disposable/reusable sampling equipment (e.g., compression fittings) was decontaminated prior to the collection of each analytical sample by spraying with Alconox or Liquinox and distilled water. For vapor sampling equipment, a 15 mL hand pump was attached to the sampling apparatus and ambient air was pumped into the sampling apparatus to remove any internal dust particles or moisture. Personnel and small equipment decontamination was performed at the sample locations.

Investigation Derived Waste

Investigation derived waste (IDW) for this sampling event included PPE and expendable materials (e.g., gloves and tubing), which has a low probability of impact. The expendable materials were collected in trash bags and disposed with municipal waste.

3.3 SAMPLE HANDLING AND LABORATORY TESTING

Sample Handling

Stainless-steel canisters were labeled with a sample ID, site name, sampler initials, sample date and time, the parameters that were to be analyzed, and pre- and post- vacuum readings. After collection, the samples were logged on a chain-of-custody (COC) form and packaged in a UN-certified box to prevent damage during shipment. The samples were then delivered under the proper COC documentation to the laboratory. Due to the potential flammable nature of the vapor in the stainless-steel canisters, some soil vapor samples were shipped as hazardous materials according to applicable International Civil Aviation Organization (ICAO) regulations.

Laboratory Testing

Eurofins Air Toxics, Inc. (Eurofins) of Folsom, California conducted the laboratory testing and the following test methods were utilized during this scope of work:

- Volatile Organic Compounds (VOCs) via Modified USEPA Total Organic-15 (TO-15) (including butane and isopentane) for soil vapor, and
- Natural gases (defined for purposes of this report as oxygen, nitrogen, carbon monoxide, methane, carbon dioxide, ethane, and ethene) via Modified ASTM D-1946 + Helium for soil vapor.

URS worked with the laboratory to attain reporting limits for compounds that have screening criteria so that, to the extent possible, they were less than the screening criteria. In some cases,

this necessitated reporting results between the method detection limit (MDL) and reporting limit (RL). Although results reported in this range are "J"-flagged as estimated, these data may be beneficial in cases where analytes would otherwise be reported as non-detect at RLs above screening levels. The laboratory provided URS with a list of their "base" RL capability for target analytes. Sample RLs are a product of base RL, pressurization dilution factor, and analytical dilution factor. Thus the sample RL will increase with increases in dilution factor. Results that were reported below the RLs but above the MDL were "J"-flagged as estimated concentrations by the laboratory.

3.4 DATA QUALITY REVIEW AND DATA MANAGEMENT

Laboratory data were provided in electronic form, and analytical data were independently reviewed and qualified by URS. One hundred percent of the data were subjected to a data quality review (Level 3 review). Evaluation of the data followed procedures outlined in the USEPA National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2008). Specific criteria reviewed included sample receipt condition and holding times, method blanks, surrogate spike recoveries, laboratory control samples, results reported from dilutions, and field duplicate results. The laboratory assigned data qualifiers on the basis of their quality control or to indicate sample analysis information (e.g., dilutions). Data qualifiers were also added by URS, as appropriate, and are included on the data tables and laboratory result pages. Laboratory data reports along with data reviews are included in **Appendix A**.

The screening values used were presented in the IEPA's Tiered Approach to Corrective Action Objectives (TACO) Title 35 – Part 742; Appendix B, Table H: Tier 1 Soil Gas and Groundwater Remediation Objectives for the Indoor Inhalation Exposure Route – Diffusion and Advection for soil vapor effective July 15, 2013 and are shown on **Table 4.** Not all TO-15 Method constituents have TACO screening criteria.

Field data and documentation collected as part of this scope of work became part of the project file. URS maintains the files for the site and the database management system.

The following documentation was completed and supplements the COC records, excluding SVE system data which are described in **Section 5**:

- Field logbooks;
- Groundwater field gauging sheets;
- Soil vapor sample collection sheets;
- Field sample collection data via electronic Toughbook®; and
- Safety documentation

4.1 DATA QUALITY REVIEW RESULTS

A total of 148 investigative and 15 field duplicate samples were collected from VMPs for analysis of VOCs (TO-15 analytes) and natural gases. Compounds qualified by URS due to method blank contamination, field duplicate results, and quality control sample recoveries are specified in the data reviews (**Appendix A**). Based on method blanks, laboratory control sample recoveries, results reported from dilutions, and field duplicate results, soil vapor results reported for the analyses performed were accepted for their intended use.

4.2 SOIL VAPOR ANALYTICAL RESULTS

The following TO-15 analytes were detected at concentrations at or above the reporting limit in soil vapor during the 2Q13 sampling event:

TO-15 Detections

Acetone	4-Methyl-2-pentanone
Benzene	Methyl tert Butyl Ether (MTBE)
Bromodichloromethane	n-Propylbenzene
Butane	2-Propanol
2-Butanone	Tetrachloroethene
Carbon disulfide	Tetrahydrofuran
Chloroform	Toluene
Cyclohexane	1,1,1-Trichloroethane
Ethanol	Trichlorofluoromethane
Ethylbenzene	1,2,4-Trimethylbenzene
4-Ethyltoluene	1,3,5-Trimethylbenzene
Heptane	2,2,4-Trimethylpentane
Hexane	m,p-Xylene
Isopentane	o-Xylene
Isopropylbenzene (Cumene)	

Additionally, several compounds were detected at concentrations estimated below the reporting limit.

Cumulative tabular summaries of the analytical results for the Village are presented in **Table 5** and the Roxana Public Works Yard and WRR are presented in **Table 6.** Analytical results were compared to the previously mentioned screening values. Sample results from VMP-1 through VMP-9, VMP-18 through VMP-24, VMP-31, VMP-32, VMP-42 through VMP-45, and VMP-47 through 54 (located near residences in the Village) were compared against the residential screening criteria. Samples from VMP-10 through VMP-17, VMP-25, VMP-29, VMP-30, VMP-41, and VMP-55 (located at or near the Public Works Yard or WRR) were compared against the industrial/commercial screening criteria. A cumulative tabular summary of the

results for natural gases are presented in **Table 7.** The laboratory analytical reports for the soil vapor samples collected during 2Q13 sampling event can be viewed in **Appendix A.**

VMP-47 was reinstalled on May 29, 2013. Evaluations of the data collected at VMP-47 are currently underway. For additional information refer to **Section 5.2.**

Benzene was selected as the key analyte to characterize soil vapor, in the paragraphs below.

Village

Detected concentrations of benzene from locations within the Village ranged from an estimated 0.00088 mg/m^3 (VMP-51-5) to 100 mg/m^3 (VMP-50-30). The results of screening for samples collected in the Village against the residential screening criterion indicate that nine of the sample locations had at least one port with a benzene concentration above the residential screening criterion (0.37 mg/m^3) during this sampling event. The cumulative results for benzene in soil vapor for samples collected in the Village are depicted on **Figure 5**.

Analytical results also identified an exceedance of the residential screening criterion for m,p-Xylene and o-Xylenes at VMP 4-23.5, VMP-4-39, and VMP-50-30. Exceedances of m,p-Xylene and o-Xylenes have been observed at these three locations in prior sampling events. VMP-31-30 and VMP-32-30 had exceedances of m,p-Xylene and o-Xylenes for the first time in 2Q13.

Roxana Public Works Yard Area

Benzene concentrations from locations within the Roxana Public Works Yard and the area along Illinois Route 111 ranged from an estimated 0.0027 mg/m^3 (VMP-11-38) to 30,000 mg/m^3 (VMP-14-29). Samples from at least one port at three of the locations within the Roxana Public Works Yard exceeded the commercial/industrial screening criterion (2.8 mg/m^3) for benzene. As indicated in **Section 3.1**, the 5ft and 10ft ports at VMP-55 could not be sampled due to water present. This VMP is in the Illinois Route 111 right-of-way, and water is present in the shallow fill. Attempts to sample these locations will continue during quarterly sampling events. The cumulative results for benzene in soil vapor for samples collected in the Roxana Public Works Yard are depicted on **Figure 6**.

WRR

Benzene concentrations from the locations sampled within the WRR ranged from an estimated 0.001 mg/m^3 (VMP-12-11.5) to 1,700 mg/m^3 (VMP-12-39). Samples from at least one port at the two locations within the WRR exceeded the commercial/industrial screening criterion (2.8 mg/m^3) for benzene. Methane results from the ports at VMP-47 range from 3.4% to 5.3% and oxygen results range from 1.6% to 1.7%. These data, along with available field screening data,

are being evaluated to determine whether additional maintenance work is warranted at this VMP. The cumulative results for benzene in soil vapor for samples collected in the WRR are depicted on **Figure 7**.

Natural Gas Data

Natural gas data indicate that the concentration of methane increases from shallow to deep sample depths, but oxygen concentrations decrease from shallow to deep sample depths (methane and oxygen are generally inversely correlated in soil vapor). In general, the trend in oxygen levels in most VMPs has been upward since the SVE system has been operating. Higher oxygen levels (>5%) with lower methane levels indicate an environment capable of supporting aerobic biodegradation (Ririe et al., 1998). Oxygen levels appear to be increasing in VMPs closer to the SVE system (e.g. along Chaffer Street) in the Village. A summary of the natural gas results is presented in **Table 7.**

4.3 CONCEPTUAL SITE MODEL

Vapor Intrusion

The primary concern for shallow soil gas is the potential for intrusion through basement and/or building slabs. In September 2011, SOPUS began installation of a full scale SVE system to address the source of these vapors. The system became operational on January 31, 2012 following the completion of the 1Q12 sampling effort. The objective of the SVE system is to mitigate vapors along the West Fenceline of the WRR and in the vicinity of the Roxana Public Works Yard. Construction of the Roxana Public Works Yard portion of the SVE system was completed during 4Q12, and this portion became operational on December 3, 2012. Refer to **Section 5.1** for further discussion on SVE system operation. **Figure 8** presents a cross-section along Chaffer Street with a vertical distribution of the benzene concentrations superimposed.

At most locations, oxygen is present in the shallow depths and little or no aromatic hydrocarbons (e.g., BTEX) are present. Carbon dioxide levels are relatively high throughout the soil column at many locations, which supports that degradation of petroleum hydrocarbons is occurring via aerobic biodegradation. There is up to 30 feet of open vadose zone which allows for biological degradation of constituents in soil vapor as they slowly diffuse upwards.

C Tech Development Corporation's Environmental Visualization System PRO, Version 9.52 (EVS-PRO) was used to model the estimated distribution of benzene in the soil vapor. **Figure 9, Figure 10,** and **Figure 11** present a horizontal distribution of benzene at 5, 10, and 25 feet bgs, respectively.

Groundwater Monitoring Well Gauging and Sampling

The results for groundwater monitoring well gauging and sample are presented in the *Interim Groundwater Monitoring Program – 2nd Quarter 2013* report (URS, 2013b). **Figure 12** presents the estimated distribution of dissolved phase benzene in the groundwater. Light non-aqueous phase liquids (LNAPL) thicknesses observed during the 2Q13 comprehensive monitoring well gauging is presented in **Table 1** and shown on **Figure 13**.

As requested in the SVE system approval letter from IEPA, 2012 (Condition Number 13), this section addresses operation of the SVE system. As such, the discussion in this section will address operation of the SVE system during 2Q13.

As presented in the June 2011 *Conceptual/Final Design Report* (URS, 2011b), the May 2012 *SVE System Construction Completion Report* (URS, 2012), and the February 2013 *SVE System Construction Completion Report Addendum* (URS, 2013c), URS designed and constructed a SVE system along the West Fenceline and within the Public Works Yard. The SVE system was installed to reduce the potential for vapors from LNAPL and impacted soil and groundwater within WRR to migrate into the Village.

The SVE system consists of 34 SVE wells, 25 of which are located along the West Fenceline, three are located in the Village along East 4th Street west of Chaffer Avenue, and six are located in the Public Works Yard. The SVE wells are connected via 4-inch piping to vapor/liquid separators (VLS) and a rotary lobe positive displacement blower housed within a customized intermodal freight container ("conex") (**Figure 14**). Piping from the SVE wells feeds into the conex, where vapor moves through the VLS', before traveling through the blower and a baffle connected to a Regenerative Thermal Oxidizer (RTO). A second blower, located on the RTO side of the baffle, pushes the vapor into the RTO and adds fresh air to dilute the vapor stream as necessary.

5.1 SVE SYSTEM OPERATIONS

System start-up was initiated on January 31, 2012. Five individual header lines are connected to specific sets of SVE wells along the West Fenceline and or in the Village at 4th Street. These lines carry vapors to the RTO and the relationship between the SVE wells and the lines that they are connected is shown on **Figure 14**. As the system was starting up, vapor removal from specific sets of wells were brought on line in a systematic order. The line connected to wells SVE-3, SVE-4, and SVE-25 was brought online first systematically followed by the others until all lines and wells were in operation.

Full scale operations commenced on April 1, 2012, with all lines and all SVE wells in operation, except for those located inside the Public Works Yard. Only one of the SVE wells (SVE-20/located outside of the Public Works Yard) on that line was operational during the first three quarters of the year. Lack of access prevented SVE wells inside the Public Works Yard from being connected until December of 2012. The remaining SVE wells inside the Public Works boundary (SVE-21 through SVE-24, SVE-26, and SVE-27) connected to a 6th line were brought online December 2012 when construction of that section was completed.

Sampling of VMP-1 through VMP-46 commenced during or prior to 3Q12 (mentioned in Condition Number 9 in the IEPA, 2012 letter).

5.2 SVE MAINTENANCE ACTIVITES AND MODIFICATIONS

URS personnel have performed scheduled system maintenance as outlined in the manufacturers' suggested operations and maintenance (O&M) documents. The scheduled maintenance includes routine lubrication, and inspection of belts, oil levels, and emergency stops, along with water levels and associated switches with the vapor liquid separators (VLSs). Timing and frequency of maintenance activities is dependent on the designated intervals. Checking and cleaning of filters and components exposed to dirt and/or the elements were performed as part of a routine weekly inspection. System SVE wells and associated vaults inspections were also conducted on a weekly basis. The last scheduled 800 hour maintenance event was performed on June 20, 2013 and included among other things changing the VLS and manual dilution line air inlet filters.

On April 10, 2013 at 2015 hours the system experienced shut down due to inclement weather; the system was restarted on April 11, 2013 at 0830 hours. On May 31, 2013 the system again experienced shutdown due to inclement weather, the vicinity of the system experienced extreme storms including tornados. The system incurred no damage during inclement weather events in 2nd quarter 2013. The system shut down at approximately 2000 hours on May 31, 2013 and was restarted on June 1, 2013 at 1330 hours.

On June 25, 2013 and June 26, 2013 stack testing activities were conducted on behalf of SOPUS by Geosyntec Consultants at the SVE system. These activities required the removal of the system intake duct for installation of additional sampling ports that were required as part of the testing. To remove the intake duct and install sampling ports, the system was shut down from June 18 to June 21, 2013. Additionally, testing activities required adjusting of the system dilution intake for the purpose of modifying the chamber temperatures. Details of stack testing activities will be provided by Geosyntec under separate cover.

The following chronology outlines maintenance and repairs and includes stack testing activities and down time associated with the system during 2nd quarter 2013.

- **April 10, 2013** – System down from 2015 hours on 4/10/13 to 0830 hours on 4/11/13 due to inclement weather.
- **May 13, 2013** – Poppet valve seating was adjusted following determination of variable concentration readings from the stack. The system was shut down from 1550 hours on 5/10/13 to 5/13/13 to readjust the poppet valves.

- **May 31, 2013** – System down from 2000 hours on 5/31/13 to 1330 hours on 6/1/13 due to inclement weather.
- **June 4, 2013 –** The chart recorder data card was switched out at 1330 hours.
- **June 18, 2013 –** The system was shut down at 1700 hours for intake duct removal activities. These activities were required in conjunction with installing additional sampling ports for upcoming stack testing activities scheduled for 6/25/13. These installation activities were completed on 6/21/13 and the system restarted at 1600 hours.
- **June 24, 2013 –** The system chart recorder data collection software was modified to collect temperature readings every one minute instead of every ten minutes as was previously collected.
- **June 25, 2013 –** Stack testing activities were conducted 6/25/13 through 6/26/13. During stack testing activities the system was shut down three times for test port configuration. Shut downs occurred on 6/25/13 from 1209 hours to 1233 hours, and on 6/26/13 from 1917 hours to 1929 hours and 1933 hours to 2001 hours. Additionally, the chart recorder data collection card was exchanged on 6/25/13 at 1500 hours and on 6/26/13 at 2000 hours.

Activities associated with system maintenance, modifications, and testing were appropriately documented both in the field maintenance log maintained on site and in the office central (electronic) file.

System Modifications

Based on anomalous field screening results during the monthly SVE system monitoring of VMP-47 on January 19, 2013, the integrity of this VMP was evaluated during 2Q13. Tedlar sampling was initiated daily on January 19, 2013 at VMP-47 to evaluate the conditions at the VMP. Daily Tedlar sampling data for VMP-47 can be found in **Table 8**. VMP-47 was replaced on May 29, 2013. After the re-installation of VMP-47, anomalous field screening results were obtained during the 2Q13 quarterly sampling of the location. A vacuum pressure communication test was conducted on each port at VMP-47 on June 7, 2013 to check for potential integrity issues. Data collected from VMP-47 is currently under evaluation.

5.3 SVE SYSTEM MONITORING RESULTS

The results of field screening samples collected monthly from SVE wells and VMPs can be found in **Tables 9 and 10**, respectively. The results of the header and RTO exhaust analytical data can be found in **Table 11**. Data reviews and laboratory analytical reports for the headers

and RTO exhaust data can be found in **Appendix A**. The data required pursuant to Condition Number 11 of the IEPA, 2012 letter are contained in those tables.

SVE Well & VMP Tedlar Sampling Details:

- 34 SVE wells were sampled monthly. SVE wells are shown on **Figure 14**.
  - SVE-3, SVE-4, and SVE-25 are located in the Village
  - SVE-5 through SVE-20 and SVE-26 through SVE-36 are located on WRR North Property
  - SVE-21 through SVE-24, SVE-26, and SVE-27 are located on Roxana Public Works Property
- 38 VMPs were sampled this quarter (VMP-1 through VMP-7, VMP-9, VMP-12, VMP-17, VMP-19, VMP-26 through VMP-28, VMP-31 through VMP-40, and VMP-42 through VMP-55)
- With the exception of VMP-17 and VMP-19, VMP locations contain either 3 or 4 screen depths between 5 feet and 42 feet bgs. Locations VMP-17 and VMP-19 contain only one. VMP depths are provided in **Table 2**.

SVE System Monitoring Results:

- The reduction in hydrocarbon concentration at SVE extraction wells and nearby VMPs has continued due to daily monitoring and adjustments of the SVE system (addition of Roxana Public Works SVE wells and continued reduction of dilution air). See mass removal calculation discussion details in **Section 5.4**.
- Vacuum measurements were obtained monthly at the SVE wells and selected VMPs within the Village and WRR. Vacuum data can be found in **Table 9 and 10**.
- Differential pressure data collected from each SVE leg located at the RTO were obtained and can be found in **Appendix B**.

Trends related to hydrocarbon concentrations monitored in the field are expected to continue, and these numbers are expected to improve as the system is operated and/or optimized.

5.4 SYSTEM OPERATION EVALUATION

A key focus of the system operation thus far has been stability and consistency. The system has been more than 93% operational since its start-up. For the months of April, May, and June 2013, the system uptimes were 98.3%, 89.8%, and 88.1% respectively.

April			May			June		
Total Time	Total Uptime	Percentage Uptime	Total Time	Total Uptime	Percentage Uptime	Total Time	Total Uptime	Percentage Uptime
720 hours	707.5 hours	**98.3 %**	744 hours	668 hours	**89.8%**	720 hours	634.25 hours	**88.1%**

The demonstrated consistency of subsurface vacuum levels, not only in SVE wells, but also in the VMP's, reflects well on the status of the system operation to this point. The system will be operating under optimal vacuum conditions when all supplemental and engineered dilution is eliminated from the RTO intake. Due to high soil vapor concentrations, supplementary dilution air to the RTO unit has been required in order to maintain optimal operating temperatures and conditions within the RTO. In order to achieve optimal influence of the system vacuum, the dilution air must be eliminated. Currently, only the engineered manual dilution valve located above the system blower is in use. As the manual dilution air is eliminated from the system, both vacuum and radius of influence within the system area are expected to increase.

Hydrocarbon Mass Removal

The total hydrocarbon mass of soil vapor removed by the SVE system was estimated by measuring the total hydrocarbon concentrations of the extracted soil vapors and the soil vapor flow rates into the SVE system. The results of the header and RTO exhaust analytical data can be found in **Table 11**. A FID calibrated with methane was used to measure total hydrocarbon concentrations in samples collected from the West Fenceline Header and the Public Works Header. Total header hydrocarbon concentrations are included in **Appendix C**.

Total soil vapor flow rates were determined by calculating flow rates for the individual SVE legs that carry vapors from the SVE wells to the SVE system. Pressure, differential pressure, and temperature were measured in each leg. This data and Equation 2.7 and Equation 2.8 from USEPA Test Method 2 "Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)" (Method 2) were used to calculate flow rates for each leg[6]. The flow rates for the appropriate legs were summed to determine flow rates in the West Fenceline Header and the Public Works Header. Flow rates are included in **Appendix D**. Only flow rates and concentrations samples taken on the same day were used to calculate mass removal.

At times, supplemental ports added dilution air to the soil vapors flowing into RTO. The dilution value settings were documented for the periods during sample collection. In order to account for

[6] USEPA Method 2 "Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)" specifies that a default pitot tube coefficient of 0.99 shall be used to calculate flow if the coefficient is unknown and the tube is designed according to the criteria of Sections 6.7.1 to 6.7.5 of this method. During the 2nd Quarter 2013, a review of the calculation was performed and it was noted that a 0.67 coefficient should be used for the specific pitot tubes used to collect data at the site. URS has corrected the previously calculated mass removal to reflect the 0.67 pitot tube coefficient.

the dilution air's contribution to the flow in the header, dilution air measurements were obtained for each dilution valve setting documented using the method described in the paragraph above. These dilution measurements were added to the appropriate header flow rates in order to estimate the total flow through the header during each concentration sampling event.

Hydrocarbon mass removed for the period between each concentration sample was calculated using the following equation:

$$M_{THC} = Q \times 60 \times \varphi \times \frac{M_c}{385.1 \times 10^6} \times h \div 2000$$

Where:

$M_{THC} = Hydrocarbon\ mass\ removed\ for\ the\ period\ (tons)$

$Q = Total\ header\ flowrate\ (SCFM)$

$\varphi = Total\ hydrocarbon\ concentration\ (ppmv)$

$M_C = Molecular\ weight\ of\ total\ hydrocarbons\ \left({}^{lb}/_{lb-mole}\right)$

$h = Period\ SVE\ operating\ hours\ (hours)$

Unit conversions:

$60\ minutes\ per\ hour$

$\frac{M_c}{385.1 \times 10^6}\ converts\ (ppmv) to\ \left({}^{lb}/_{SCF}\right)$

$2000\ pounds\ per\ tons$

Header samples from **Table 11** were used to estimate molecular weights for the west fence line and public works headers.

These molecular weights from an average of the header samples in 2Q13 based on detected TO-15 analytes, 27.7 lb/lb-mole and 20.1 lb/lb-mole respectively, were used to convert header hydrocarbon volume concentrations (ppmv) to mass concentrations (lb/SCF). The conversion from volume concentration (ppmv) to mass concentrations (lb/SCF) was taken from the USEPA document *AP-42 Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources*, Fifth Edition, Appendix A (USEPA, 1995). The total hydrocarbon mass removed during each period was summed to determine the quarterly total hydrocarbon mass removed. The mass removed is summarized in the table below.

Quarterly Total Hydrocarbon Mass Removed

Quarter	West Fence Line Mass	Public Works Mass	Quarterly Mass	Total Mass
	(tons)	(tons)	(tons)	(tons)
2Q12	124	36	160	160
3Q12	96	23	119	279
4Q12	53	22	75	354
1Q13	39	12	51	405
2Q13	60	17	77	482

5.5 SVE SYSTEM MODIFICATION RECOMMENDATIONS

A key focus of the system operators is public and worker safety. Operation of the SVE system will continue with maintenance and system optimization activities. Future monitoring and sampling results from data points associated with the SVE system will be the primary driver of optimization efforts. Optimization efforts could include reduction in dilution air, valve adjustment of individual SVE wells and legs of the SVE system to direct more or less vacuum to areas.

URS conducted the 2Q13 soil vapor sampling and SVE monitoring efforts on behalf of SOPUS in the Village, Roxana Public Works Yard, and adjoining portions of the WRR. The following conclusions are based on the data collected during 1Q13:

- Soil vapor samples were collected from 43 locations and 148 ports during 2Q13. The locations of higher soil vapor concentrations generally coincide with areas of the higher observed groundwater impact.
- Benzene concentrations within the Village range from parts per billion (ppb) in the shallow samples to hundreds of parts per million (ppm) in deeper samples. The residential screening criterion was exceeded in at least one port at VMP-2, VMP-3, VMP-4, VMP-31, VMP-32, VMP-44, VMP-47, VMP-50, and VMP-53. Of these VMPs, only one shallow port (<10 ft depth) exceeded the residential screening criterion, which was VMP-47-5.
- Benzene concentrations within Roxana Public Works Yard and WRR range from ppb in the shallow samples to tens of thousands of ppm in deeper samples. The commercial/industrial screening criterion was exceeded in at least one port at VMP-13, VMP-14, and VMP-25 within Roxana Public Works Yard and VMP-12 and VMP-16 within WRR.
- VMP-3-5 and VMP-7 were replaced in 2Q13. VMP-47 was replaced during 2Q13; however, based on subsequent data, additional evaluations are in progress.
- As presented in detail above, the SVE system continues to operate efficiently and effectively.

NOTES:
1) Elevations presented in this table are relative to the 1988 USGS datum.
2) The Corrected W.L. Elevations presented in this table were corrected by a specific gravity of 0.80 for the wells in which LNAPL was identified.
3) NA = Not Applicable; NE = Not Encountered; NM = Not Measured
4) * Indicates that the LNAPL and/or water level is above the top of the screened zone of the well.
5) Table includes comprehensive groundwater monitoring well gauging data from the combined Village of Roxana Interim Groundwater Monitoring Program and the WRB Refining LP Wood River Refinery Program.

Notes:
1. November 2009 Sampling and the June 2010 Supplemental utilized a MuitiRAE IR for CO2 readings. Any CO2 over 5% resulted in a "OVR" reading. No direct CH4 or secondary LEL and 02 readings were collected.
2. Flame ionization detection (FID) was not used during the November 2009 Sampling or the June 2010 Supplemental.
3. OVR is used to indicate a reading over range for the FID or MultiRAE.
4. The Landtec landfill gas analyzer displays "OVR" for any results calculated higher than 99.9% for an individual reading.
5. N/A is used to indicate that a reading was not collected because it was unnecessary (i.e., a direct port for helium if the helium leak check was successful).
6. NS is used to indicate that a reading was not collected because the port could not be sampled.
7. NM is used to indicate a reading that was not collected because the MultiGas meter was not used beginning 2Q12.
8. FID readings were taken with a TVA-1000. Due to oxygen concentrations less than 16% a dilution tip was used when analyzing samples. The dilution tip introduced ambient air in a 10:1 ration with the sample, which required the sample readings to be multiplied by 10 to get the actual reading. The FID readings in this spreadsheet illustrate the actual FID values that were represented in each sample.
9. VMP sample port successfully resampled after helium leak check failure.
10. VMP sample port unsuccessfully sampled after three attempts due to helium leak check failures.
11. VMP sample port resampled due to issues with the canister after analyzed by the laboratory.
12. VMP sample port resampled due to issues with the canister in the field.
13. VMP sample port not sampled because screen submerged below water table.
14. VMP sample port resampled to verify results from the laboratory.
15. Negative readings on the FID are recorded as zero.
16. Helium not used to obtain sample.
17. VMP sample port unsuccessfully resampled after integrity issue discovered.
18. * Sample result is suspect.

TABLE 4
SOIL VAPOR SCREENING CRITERIA

Chemical	Residential (mg/m^3)	Industrial/ Commercial (mg/m^3)
TO-15 Analytes		
Acetone	750,000	750,000
Benzene	0.37	2.8

Notes

Lab Qualifiers

J = Estimated value; results between the MDL and RL

U = Compound analyzed for but not detected above the RL

URS Qualifiers

J = Estimated detection

UJ = Estimated non-detect

U = Non-detect due to blank contamination

SEE LAST PAGE OF TABLE FOR NOTES
